3. Providing adequate/competent on-site support and consultative resources for you? Yes 8 No 8

Comments:

- Most excellent in this regard. I wish I had taken more advantage of this resource during the time.

- The resources were there (perhaps a little too late), but few took advantage of them (including me).

- Resources frequently weren't used because QWL had lower priority than pressing production problems.

- I feel that MFC could have been more aggressive.

- The support was overwhelming before the action started, but as the action increased the support decreased.

- Emphasis seems to have been in QA which generally operates (in my experience) along participative lines.

- The counseling of myself with regard to the psychology test we asked to take was useless. It appeared that Dr. Glaser was more intent upon evaluating his test than the person. I had expected to get a profile of myself, my weaknesses and strengths, and how to deal with each. This particular effort in my opinion was a total waste.

Figure 9 (Continued)

- This aspect of the HIRI effort was clearly deficient. Even before CI went to Russia, we needed more day-to-day help. After he left, the QWL program really suffered. MFC tried hard, but it was not enough. At about the same time, Crown's financial situation caused a cutback in CMS personnel time and resources, which compounded the deficiency.

- MFC was idealistic, inexperienced, and a waste of time and money. She was personally involved with some employees and could not make objective evaluations.

4. Provide you with the mechanics to enable you to give/get feedback on and to evaluate the QWL project? Yes 10 No 6

Comments:

- Feedback could have been more detailed and presented in a much better fashion.

- More discussion of how to develop trust in your employees and promote feedback would have been helpful. Although HIRI worked hard on this problem, even more time involvement was necessary.

- Evaluation techniques are often boring and time-consuming and on-the-job problems always take precedence over such evaluation, so I'm sure HIRI's efforts went unnoticed and were, therefore, less valuable. Perhaps different (more interesting, such as C/C actual case studies) evaluative aids would have been more pertinent and successful.

- Too much. Time should have been spent on solving plant problems, not feelings, moods, etc.

- I was always unsure of the HIRI opinion of how the project was working.

- HIRI feedback should have been more specific and set up to enable routine/periodic feedback on a scheduled basis (not just when problems occurred). Possibly the ISR feedback took the place of a HIRI feedback system, but it was not the same as we should have had from HIRI.

- ISR did provide some feedback, however.

- ISR was a separate concern. I feel the program would have been greatly improved with better feedback. But was this one of the QWL's objectives?

Figure 9 (Continued)

5. Was there a major problem which you experienced with the QWL program which you feel could have been avoided with help from HIRI? Yes 7 No 8

Comments:

- In terms of setting objectives at the first of the program.
- The lack of adequate on-site, day-to-day consultative assistance caused many problems which could have been and should have been avoided. The lack of HIRI support for the Personnel Manager's role in coordinating the program hurt. This could have been avoided by HIRI including the Personnel Manager in all aspects rather than mostly excluding him during HIRI plant visits.
- MFC created problems for me by getting involved when she was not wanted or needed.

6. In your opinion, has the QWL program been successful (helpful)? Yes 13 No 4

Comments:

- It gave us some initial direction for our management development.
- I do not believe that we would enjoy the successes we have without the QWL project.
- Very much so in QA. I don't feel the same about manufacturing.
- Training provided was helpful and valuable. The timing of the project with start-up probably caused slightly negative effect overall.
- Most certainly. Now let us have a program on Theory X management so when we fail with the QWL suggestions we will have somewhere to turn.
- I feel it has been successful to a limited degree and I am hopeful that we can retain and build on the successful aspects.
- Yes, because at least everyone is aware that such programs and organizational structures as QWL do exist, and has been indoctrinated that this type of work structure is preferable to more traditional management styles. It, therefore, seems more likely that supervisors and managers will be more critical and evalua-

tive of their own management styles in terms of QWL, which should lead to implementation of at least some QWL goals.

- Somewhat helpful in providing an awareness of QWL ingredients.

- Why don't we call the God-damned thing like it is and forget about it and get on with the business of making a profit for our company.

7. Should we have undertaken it?

Yes 16 No 1

Comments:

- I think the timing was poor.

- I do feel that having accepted the program, we should have committed ourselves to achieving success.

- This is the type of program that all industry must conform to. People will no longer work unless they have a "say" in their working environment.

- Yes, but with qualified, experienced people in all areas.

- I feel I have learned much from the program, and feel C/C has benefited in many other areas as well.

- Yes, but not until two years after plant start-up. We should have had it planned, let everyone know that we wanted to evolve into it and implemented it in scheduled stages--but starting out with the traditional, less demanding/time consuming managerial style.

- One year later.

- Even this much change from traditional management is worth the effort invested.

- Yes, but the project and its goals must continue to be developed and communicated to new employees. Our present training program and orientation needs to be extended and expanded. The time must be made available.

8. If we had an opportunity to "do it over again," what changes would you recommend?

Comments Offered 14
Comments Not Offered 3

Comments:

- Relate the program to the actual problems of the plant

Figure 9 (Continued)

in operation. Develop a confidence that each person's problems and viewpoints would not be discussed with the others and subject to misinterpretation, etc. Establish a more definite commitment from CMS management toward the program.

- (1) Decide on success; (2) have a periodic evaluation of people and group status; (3) get rid of people that can't get it done; (4) achieve your goals.

- (1) More direct feedback more frequently from the HIRI group. They are the experts who were qualified to judge the progress of the project. I wish that they would have spoken out more directly.
  (2) Hire a more experienced group in extraction.

- I would suggest that the supervisors and managers be taught about open communications but to keep a firm hold on their own responsibilities to the company and not go through all this training of employees in QWL which seemed to leave them with wrong impressions.

- More support from upper and middle management.

- Undertake such a program after plant qualified, operating, systems in place, management time available.

- Better presentation of the project. More "on-site" consultation by the "higher-ups" in the HIRI project. Better commitment by department managers and the general manager.

- Get experienced consultants who would not have let inexperienced people be hired to start up a new plant. Concentrate on the results and work on improving the methods, instead of having good methods with no results. Spend as much time in technical training of supervisors as was spent on the personnel relations training.

- (1) HIRI on-site intervention earlier
  (2) Aggressive HIRI intervention
  (3) Group problem-solving sessions (dealing in specifics at C/C)
  (4) Routine critiques (like the session on the first draft for final report) so we could find out how everyone "saw" QWL efforts and his own performance.

- (1) A far more extensive overall view of QWL and its principles, as projected for C/C.
  (2) An encounter session for all management to reduce inhibitions between management levels.

Figure 9 (Continued)

(3) Approval of upper management to permit persons to experiment with QWL. (This was almost impossible under the pressures of start-up.)
(4) Begin QWL program after qualification by BoB.

- An unwavering commitment must be obtained from top management to undertake this program and to allow the plant the time and the financial support required for such a program to be successfully initiated.

- (1) Have Theory Y personnel manager to provide in-house coordination.
  (2) Use program to achieve top quarter of learning curve, not bottom half. Use program to achieve that added measure of efficiency of an outstanding plant.

- Keep Izard in the U.S. Russian trip broke communication, MFC couldn't fill his shoes. I think project began to suffer in his absence.

- This question would take about three days to answer. I feel the recommendations I made during the program still hold true.

9. Do you have any other comments about the QWL program?

Comments Offered 7
Comments Not Offered 10

Comments:

- I believe that QWL is determined basically by the nature of the individuals involved with amplification dependent on the authority level of the individuals. The makeup of a person is pretty much determined before he becomes an employee. Modification must take place to adjust and relate to the people and facility environment. The success of the adjustment and relation and hence the QWL is largely determined by the matching of personal makeups (assuming the facility environment is acceptable) rather than by training.

- I think that many of the problems were encountered because employees expected and some still expect to get anything they ask for.

- It is a good idea--needs more emphasis in realistic situations--needs total involvement, not opposition.

- The name of the project should have been, "Improving Productivity, and in the Process, Improving the Quality of Work Life."

Figure 9 (Continued)

- I feel it was a great idea for this plant, and feel others could benefit with it.

- It is very worthwhile and, frankly, almost essential to do this if we are to increase employee work satisfactions and productivity/quality. If companies continue in the traditional mode, I do not think the free enterprise system in America can survive.

- My comments would be more than I am willing to spend time writing down. If anyone would like to discuss the matter, I would be willing to do so. Only one general comment: A poor workman always blames his tools! Don't blame the program for the problems we have had. If blame is necessary, then blame the people that implemented it!

It may be of interest here to include a graph (Figure 10) from ISR's data, which plots the plant average figures as of January 1975, in response to 16 questions on their Monthly Short Form Feedback Report, compared with the average figures for the department with the lowest morale figures. This department was headed by a new manager brought in from another of the company's plants who had extensive mass production manufacturing experience, little or no knowledge of biological technology, and a hard-nosed, authoritarian "let's get moving without delay" approach to the production obstacles. Concerted resistance from his supervisors and workforce soon developed, and led to a difficult impasse which required considerable attention, confrontation, and "ironing out."

PAGE 118 CONTAINING FIGURE 10 "RESPONSES TO JANUARY 1975 ISR MONTHLY SHORT FORM FEEDBACK" WAS NOT REPRODUCIBLE AND WAS REMOVED FROM THIS DOCUMENT PRIOR TO ITS BEING SUBMITTED TO THE ERIC DOCUMENT REPRODUCTION SERVICE.

An Evaluation in Light of the Glaser and the Hackman Key Conditions for QWL Success

A final evaluation of the C/C QWL intervention may be made here with regard to what Glaser (in press) and Hackman (1975) consider to be key conditions for sustained success of QWL projects.* These conditions and their application to the C/C situation are listed below:

Glaser	Comment
1. Creating a work climate that would offer attentive, respectful, constructive response to employee desires for such things as having a meaningful voice in decisions about their work, job enrichment, feedback on progress toward attainment of agreed-upon goals, etc.	1. Explicitly planned for at C/C; largely, but not optimally implemented
2. Providing sustained support of the QWL effort by the organization's leaders.	2. Provided initially and explicitly in planning with CMS top management and local Centerton management; not sustained adequately after company was sold in February 1974 and new top management, which had not been a party to DOL-CMS-HIRI-ISR agreement, was installed.
3. Involving the line organization in designing and then assuming responsibility for the program as theirs.	3. Efforts were made by consultants in this direction, but under the stresses previously described, the line organization was not able to sustain their responsibility for the program.

*Both sets of conditions should be viewed as pre-conditions, criteria that should be attended to and implemented from the beginning.

Glaser	Comment
4. Working out specific attainable goals with task groups or individuals... plus a system of rewards for goal attainment, and an adequate training program --then providing structure and frequent timely feedback to let all concerned know about progress or problems.	4. C/C local managment did not do this systematically. There was training, of course, but experience revealed some gaps in needed types of coverage. Some key goals, such as to get the equipment and processes "debugged" so that products could be produced and sold, were obvious, all-consuming, and were achieved remarkably well under the circumstances. Specific goals, for departments or for task groups were not spelled out in sufficient detail or monitored closely for performance progress.
5. Monitoring or auditing in helpful ways to assist in problem solving and to assure high standards of performance.	5. There was relatively little of this until November 1974, when bottlenecks and delays became so serious that the plant manager personally stepped into certain departments to study and solve some too long-standing problems. Procedures for initiating such actions are still not worked out well.

Thus, on all five of these important conditions, the consultants would rate C/C with less than an "A", and would rate their own effectiveness as less than "A" in helping C/C to achieve those conditions. We might add that no major change (such as introducing a QWL project) should be initiated unless or until certain organizational conditions regarded as essential to support the change are present. This is not to say that QWL should not be attempted in organizations that are experiencing adversity. Many organizations will be more receptive to change when they encounter seriously threatening problems. But the QWL effort must become a better way of focusing on and coping with or overcoming those problems, aside from other "dividends."

Hackman	Comment
1. Key individuals responsible for the work redesign project should attack the especially difficult problems right from the start.	1. All of the issues Hackman lists as related to this ingredient were attended to by both C/C management and the consultants from the start. Certain other kinds of issues, however, such as the need for in-depth training in supervisory practices, for problem solving, for goal setting, and for unobtrusive monitoring of timely progress toward goal attainment, were not adequately foreseen by either C/C management or by the consultants. The consultants assumed that the C/C managers and supervisors would be ready and able to meet these needs. As it turned out, if they were potentially able to do so they didn't, in the press of trying to cope with the urgent everyday problems involved in plant start-up. Further, the relationship between plant and corporation was not defined in a flexible way to specify areas of freedom from traditional policies.
2. Management should make sure that a diagnosis of the changes needed in the target jobs, based on some articulated theory of work redesign, is conducted before implementation.	2. Diagnostic efforts were made in early planning, and as a consequence the job design and staffing arrangements differed considerably from the way this work was structured at the parent plant which produced the same biological products. Whether the diagnosis was as accurate as might be desired remains to be seen; probably it (like anything) could have been better.

Hackman	Comment
3. Management should insure that specific changes are publicly discussed and based explicitly on the diagnosis.	3. Accomplished, but perhaps not as systematically and rigorously as Hackman suggests.
4. The people responsible for the work project should prepare contingency plans ahead of time to deal with both the problems and opportunities that emerge from work redesign activities.	4. This was not done adequately. It is very doubtful that all of the key contingencies were "foreseeable," but some were. Better simulation planning by C/C management together with strong assistance from the consultants should have been provided.
5. Those responsible for the work redesign project should be prepared to evaluate the project continuously throughout its life.	5. This was considered explicitly and carefully in the initial planning. Plans for frequent plant-level review and "taking stock" were made but were not carried out thoroughly. Corporate management, for various reasons, has been reluctant to allow evaluation of home office plant performance for comparison with Centerton. On some important considerations, the corporate management information system does not appear set up for or currently capable of providing the desired evaluative data. Whether survey-type evaluation will be continued at C/C after ISR leaves is quite doubtful.

Thus, in relation to Hackman's key ingredients, all were considered, some attended to very well in the initial planning, and one of them--contingency planning--not done astutely or foresightedly enough.

As Wood and Rasmussen (1975) have noted, the quality of worklife is affected by (1) organizational factors, such as responsiveness of the work culture to employee and customer needs; character of communication up, down, and laterally; personal development opportunities, work structure; (2) physical conditions at work, such

as space, light, heat, noise, toxic agents, esthetics; (3) social factors, such as leadership style, interaction opportunity, work team membership; (4) job characteristics, such as autonomy, skill variety or challenge, pace, task identity or closure, work schedules, task significance, feedback, effort requirements; and (5) economic considerations, such as pay, benefits, security: reward amount and perceived reward equity. When these factors are perceived by the workforce to be favorable, then ego-involvement, QWL, and productivity are likely to be greater than in work environments that are perceived by the workforce as poor or relatively unfavorable. Presumably the ISR final evaluation will include survey data to measure those perceptions at C/C.

What Might Work Better in the Future: Considerations and Recommendations for Other QWL Interventions

In the conduct of QWL interventions, we recommend consideration of the following points, some of which were fully recognized in this intervention, some of which became clearer as the project evolved, and some of which, although recognized, were not carried out as skillfully as might--in retrospect--have been possible.

1. Preliminary planning for implementation of a QWL program in a start-up situation involves:

   a. Clarifying the relationship of corporate management to

      (1) the project;
      (2) the plant in which the project is undertaken.

      Such clarification must include the creation of adequate channels of communication among plant, corporate headquarters, and consultants (if any).

   b. Creating a plant committee with specific QWL implementation and monitoring responsibility.

   c. Collaboratively (with above group) establishing agreed-upon goals and procedures for goal attainment, codifying same; e.g.,

      (1) devising systems to support goals;
      (2) creating written material about goals and measurements of progress toward them;
      (3) establishing review mechanisms;
      (4) assigning responsibility for follow-up.

   d. Anticipating problems.

      (1) reviewing sources of previous experience (including literature pertaining to QWL experiments) to anticipate problems;

(2) making contingency plans where problems can be anticipated;
(3) providing flexible adaptation mechanisms;
(4) assuring that there is enough technical competence present on-site or readily available for consultation to deal with the difficult, extraordinary process and equipment problems that experience shows are likely to occur from time to time.

e. Designing training programs based on a realistic assessment of the needs of the specific individuals in the participating group; planning recurring training programs to meet newly identified needs. The design should include consideration of successful transition from training to actual implementation in an operational situation.

f. Structuring opportunities for three-way communication flow; working constantly to structure all parts of the QWL program--management, trainers, workforce--into an integrated, mutually supportive, complementary system.

g. Planning for orientation and instruction of new managers and supervisors.

2. Managers should set up the expectation that problems will arise and should be regarded merely as items needing attention, not as signs of crisis or failure. Modification of procedures or plans should be expected as legitimate outcomes of learning and experience; the group should expect and look forward to change.

3. QWL concepts should be quite clear, understood, and accepted or argued out by all concerned. After agreement on the program, adherence to whatever may be agreed to as essential should be required from those involved. Evaluation-of-progress measures that are taken should be described in the normal everyday terminology in current use in the company, and should relate to the never-ending quest for competent, reliable organizational performance under working conditions that, at least insofar as practicable, take account of people's needs.

4. When an organization feels harried by many serious problems clamoring urgently for attention, QWL consideration or participative styles of decision making need to be perceived as appropriate and relevant to improved problem solving and mission performance or organizational effectiveness. In order for this to occur, people must believe this <u>before</u> the clamoring of problems arises. Results of QWL interventions should be made phenomenologically evident.

5. Persons working in an organization that is concerned with QWL improvement need to be clear about the need for productive task performance, and also need to be clear about the nature of decision-making processes in matters that affect them. The purpose, role, and outcome expectations from meetings must be clarified, and feedback on proposals made at such meetings should be unfailingly disseminated.

6. QWL consultants should work for top management and for an internal group that has responsibility for organization development in the QWL area. (This should include representatives of the union in situations where the employees are members of a labor union.) When outside consultants are invited by an organization to help develop and implement a QWL or an organizational development (OD) program, their most desirable strategy would be to have management create within the organization a well-respected, influential internal consulting group that will serve as consultants to the organization. The outside consultant becomes the consultant for the internal group, aside from consultation with individuals, work teams, and departmental groups. Then not only does the outside consultant help them identify problems, but in the process works with them to develop a methodology for solving problems and assessing outcomes of such efforts. The consultant contributes to immediate solutions and also to the ability of the organization to respond effectively to future problems. However, the consultant must avoid becoming seen as subverting or interfering with the acceptance of managerial authority.

   As an overall objective, the consultant's role should be to help the client organization develop a sustained problem-solving orientation and the organizational and managerial capacity to make it work. A way of providing that help, as suggested by the Group on School Capacity for Problem Solving, National Institute of Education (1975), is to encourage the organization "to make provisions for appropriate people coming together to share perceptions; define problems; generate or search out a range of possible solutions; select and plan to implement a solution; carry it out; and assess the impact of their actions from all their points of view."

7. The outside consulting team should have its own contingency plans and standards for the possibility that it might need to leave before the expected end of assistance. The group might need to leave because of policy shifts in the company; or some key member of the gorup might leave because of some private contingency. In either case, the possibility should be anticipated and planned for so that the organization can be helped to adapt to the loss and provide its own continuity of effort.

BEST COPY AVAILABLE

8. The consultants should measure their own progress as a check on their productivity as consultants and to see whether the outcomes match their investment. The project goals may be met early, or the probability of accomplishing them within the allotted time may be low. In either event, the consultants should be monitoring their own progress through periodic formative evaluations, regardless of whether some independent evaluation group is charged with responsibility for a summative evaluation.

9. The selection of key personnel should be handled carefully to avoid building in handicaps to success. Administrative ability, technical competence, good leadership skills and openness to new ideas figure significantly in success. Of great importance is a person's ability to get serious interpersonal conflicts out in the open before they fester, and to do so in a problem-solving spirit. An amazing amount of psychological energy that could be applied in productive ways too frequently is used to store and guard anger, distress, embarrassment, and other similar feelings.

10. In-house models (company employees) of the desired behavior must be provided. Such models are very credible to other organization members. The modeling employees can interact with others in terms of real and important problems. (This effect was apparent in C/C where a department manager's behavior increased the open confrontation of conflict, and where an extraction supervisor established the practice of routine, constructive, nonpunitive critiques with his team and caused this procedure to spread.)

11. Participative managerial behavior and QWL support by all members of the team must be tied to a reward system if the behavior is to flourish. For instance, managers' and supervisors' performance evaluations might include consideration of how well they implemented QWL concepts.

Areas for Further Research

Several areas or issues merit further investigation in the interest of determining more effective methods of intervention and gaining a better understanding of the problems involved in trying to develop effective QWL programs. A few of these topics are posed as questions below.

1. General

   a. What kind and level of top management support is required for success of a QWL project?

BEST COPY AVAILABLE

b. What are the most effective ways of assessing organization readiness for QWL intervention?

c. What sorts of goal setting, reward system and progress feedback/monitoring will best facilitate progress toward goal attainment over the long run?

d. What attributes and experience seem to predict success for a manager or supervisor in a QWL environment?

e. What intervention methods seem to have the most positive impact on QWL development; e.g., training, leadership modeling by a manager or a consultant, apprenticeships, visits to other companies having successful QWL programs, provision of information about QWL programs to the entire workforce, then seeing if requests for such a program arise from the grass roots?

f. What are some of the better ways of continuing a strong commitment to QWL improvement in an organization when there are persistent reality needs and pressures for devoting almost all available time and energy to meeting what seem to be "survival" problems of mission performance?

2. Organizational Structure

How can an organization's readiness for QWL intervention best be measured? This question involves considering how best to measure the support of top management, the existence of adequate communication skills in the organization, and the definition of what QWL readiness might mean.*

a. Measuring the support of top management may be a "subjective" interview task. If senior corporate officials were willing to submit to formal measures of attitude, their responses to such scales as Hackman's and Oldham's Job Diagnostic Scale would define the degree of their readiness to accept PM concepts. To study the procedure of introducing QWL where there is a high or low readiness in the corporate structure, to study the effects of trying to change readiness conditions through education, and particularly to study the effects on corporate readiness of using QWL principles with the managers, suggest a number of lines of further investigation.

*A promising procedure for assessing any organization's readiness for change or innovation adoption might be borrowed from the A-VICTORY Model proposed by Howard Davis and Susan Salasin. (See Appendix I).

b. The organization can be defined in terms of the fluidity of communication in it. Is it an organization in which rumors fly and ignorance can be demonstrated? Does top management know the contents and discontents of those below; do those below understand the aims, plans, and policies of top management? Simple questionnaire methods can be devised or random samples of personnel can be interviewed for discovering the concordance of perceptions throughout an organization which define the situation of fluid communication and those of unidirectional communication or of noncommunication. To study the process of introducing QWL into organizations of different communicational complexities and to study the differential effects of such introduction on the different kinds of communication patterns is feasible research.

c. What is the irreducible minimum of QWL concepts and practices which can be expected to influence the function of an organization? What is the relationship, for instance, between the development of a small degree of PM and absenteeism? What is the relationship between fluctuations in absenteeism and fluctuations in the quality of production? What is the relationship between the development of a small degree of PM and the quality of production? Longitudinal investigations could study the gradual introduction of QWL concepts and practices to an organization, and compare the success of such a method with attempting a massive program de novo.

3. Personnel Selection Methods

In studying the readiness of any given person to enhance or resist QWL innovations, selection questions further to be studied would include personal variables and the question of "organizational fit."

a. Can we assume that such personal characteristics as flexibility (versus rigidity), people orientation (versus task orientation or thing orientation), high education level (versus low educational level), technical competence (versus relative technical ignorance), managerial experience (versus managerial naivete) are relevant to variations in how QWL will be received? If we hire people who are secure in their technical skills, are they more trainable in human relations skills, or is the introduction of QWL enhanced where people are selected for human relations skills and trained in technical skills? What differences in methods of introducing QWL are determined by the criteria of personnel selection?

If QWL concepts and practices can be introduced gradually, it seems feasible to make comparative studies of these questions.

b. The organizational fit or person and milieu is clearly important. It probably is unwise to ask someone who speaks only Greek to manage a plant in Patagonia. At the same time, is a person more ready to adapt to QWL where the QWL improvement objectives are completely compatible with his milieu, or where the person is aware of discordances? What amount of doubt, of questioning of things as they are, makes for most receptivity to the new project?

4. Training and Planning Considerations

Useful comparative studies could involve different "mixes" of educational efforts. On the one hand, are those efforts designed to clarify philosophy, values, and commitment to procedures of change or of tradition? These efforts would be concerned with understanding the relevance of behavior to the expression of attitude. They would relate to the willingness of management, for instance, to alter behavior, rather than to how they would choose to alter it.

On the other hand, educational efforts may be principally designed to provide skill training in techniques of problem solving, of opening communication, of doing something. What mix of clarification of attitude and training of skills seems best to enhance the introduction of innovations in an organization? Again, easily investigated small situations could be created to provide some answers to this question.

5. Monitoring Systems

The monitoring of results and procedures can be done unobtrusively or bluntly, by an outside person or by the performer himself, in terms of clear criteria or in terms of hazy judgments. Each choice among these possibilities may influence the acceptance of innovation.

The tying of reward to performance, the nature of the reward (positive or negative, clearly a consequence of behavior or arbitrarily attached), and the clarity of the rewarding effort are variables which can be manipulated. Where variables can be manipulated, differences in their effects on innovation can be measured.

In considering areas for further research, it is clear that the complex interactions of many factors make it unlikely that clear do's and don'ts of completely general applicability can be un-

covered. Rather, a "cookbook" of effective procedures would include alternatives keyed to different milieus (perhaps including different technologies), objectives, personalities, and histories. Because of this, procedures for introducing significant and complex innovations into an organization must first of all allow for adaptability to contingencies, whatever the ultimate aim.

HIRI-CMS-DOL-ISR QWL Project Agreements

HUMAN INTERACTION RESEARCH INSTITUTE
KIRKEBY CENTER, SUITE 1120 · 10889 WILSHIRE BOULEVARD
LOS ANGELES, CALIFORNIA 90024
(213) 879-1373

February 21, 1973

To: (Eight persons from Crown Medical Specialties management), R. Foster (DOL), G. Gibb (HIRI), C. Izard (HIRI), E. Lawler (ISR)

From: Ed Glaser

Re: Draft summary of Crown-DOL-HIRI-ISR agreement at meeting on February 9, 1973

Would you please review the following material carefully, and either advise that it seems OK, or return with your editing or questions.

Centerton Planning, Meshed with HIRI Technical Assistance Consultation

1. Crown management decision to design the new Centerton plant in anticipation of staffing with relatively small (10-25) person work teams and a task structure consistent with job enrichment principles.

2. Designation of Mr.____ as Centerton Plant Manager, and Mr.____ as Production Manager; employment of Mr. ____(January 1973) as Personnel Manager, with these three constituting the nucleus crew.

3. Provision by Ed Glaser and Cal Izard of reading material pertaining to job enrichment, and of entrée, if possible, to other companies which have had successful experience in structuring work along those lines: e.g., Procter & Gamble, AT&T, Donnelly Mirrors, Cryovac Division of W. R. Grace & Co., Motorola, General Foods.

4. Exposure of Centerton Personnel Manager to opportunities and experiences that will best enable him to assume--with full support from top line management--the guidance role in working out plans for staffing and organizing the Centerton plant: e.g.,

   a. Reading, attending seminars, and visiting other companies that successfully have worked out job enrichment programs

   b. Planning and implementing (with HIRI consultation available) detailed selection and training procedures for new categories and groups of personnel as they join the company.

   c. Developing compensation policies and procedures suitable

to the increased responsibilities involved in the job enrichment approach.

d. Establishing baseline performance data that can be compared with data from other Crown plants.

5. Discussion of detailed plans, when formulated at Centerton, in conference with appropriate persons at headquarters and HIRI technical assistance team.

6. Tryout of first job enrichment training program with an initial group of Centerton employees (shift supervisors and department managers). This training program to be developed by the consultants, checked out with the Plant Manager, Production Manager, Personnel Manager, and the corporate IR Manager, and presented jointly by the Personnel Manager and the consultants.

7. Selection (with assistance available from Cal Izard) and training of Centerton production employees.

8. Indoctrination of all employees regarding the fixed technical requirements for the preliminary design plan to produce the biological products, and invitation to raise questions or offer ideas.

9. Arrangements to send key Centerton personnel to the West Coast headquarters for training and experience in actual production of the biological products, and arrangements to train other personnel at a local Vocational Training Center.

10. Start-up of operation and production at Centerton.

The guiding principle regarding costs that should be borne by Crown and those that properly can be charged to the HIRI research grant is that Crown will pay for all activities that the company normally would undertake in order to implement the management decision to structure the work along job enrichment lines. HIRI will pay (from its Department of Labor research grant) any extra costs growing out of HIRI's research that Crown would not otherwise need to undertake. Thus, Dr. Izard's time and travel for sustained consultation to Centerton will be paid from the HIRI grant, but the Personnel Manager's travel to other companies (arranged by HIRI) to observe the implementation of job enrichment principles in production plants will be paid by Crown as normal training which the Personnel Manager would find very valuable if there were no research involvement. Re time, the assumption (or hope) is that this will be a three-year study, or that HIRI will be available for three years to work with Centerton and evaluate the impact and results.

The Department of Labor has offered to fund an independent evaluation, carried out by the Institute for Social Research, University of Michigan, of the Centerton-HIRI relationship. The guidelines for that relationship are presented below (drafted by Ed Lawler, edited by Ed Glaser).

PROPOSED RESEARCH AGREEMENT INVOLVING ISR

1. The Institute for Social Research (University of Michigan) researchers expect to conduct the study over a three-year time period. During this time period two kinds of data will be collected and analyzed.

   a. Data that normally is collected by companies as part of the personnel, cost accounting, and production management information systems. Such things as absenteeism records, grievance records and turnover records fall into this category. These data will be collected continuously by Crown and given to the researchers.

   b. Data that are collected by the researchers on a periodic basis. This would include attitude surveys and some direct observation of Centerton employees. At the present time the expectation is that employees will be surveyed when they first join Crown , 6 months after they join, 18 months after they join, and 30 months after they join.

2. The researchers agree to provide management with feedback about all data collected. The researchers also agree to help management interpret the data and give feedback of the results to the rest of the organization if this help is desired.

3. Crown will provide access to relevant company records so that the research can collect production, cost, and personnel data--unless the company wishes to supply these data to the researchers. Any such data collected will be treated confidentially by the researchers, and no company data collected of this sort will be made public in any form (e.g., publication of a research report in a scientific journal) without explicit permission and approval from Crown.

4. Crown agrees to allow the researchers access to its plants and offices so that they can observe employee behavior and working conditions.

5. The consultants (HIRI) will allow the researchers to observe and study their interactions with Centerton. And of course HIRI is free to gather whatever data they may wish and work out with Centerton in connection with their own consultation and and evaluation grant.

6. Crown will allow publication of the scientific reports of the results of the study, but Crown will have the right to veto any publication of production and cost information which might endanger their competitive position.

7. A tentative schedule for the research activity is as follows:

   a. The project would be initiated about three months before plant opening. At this time observations of consultant-

Centerton interactions would begin. This would continue for the duration of the study. All employees would be asked to complete a short questionnaire soon after they are hired. At that time the researchers and management will collaborate in designing an information system for the collection of cost, production, and personnel information.

b. Starting with the plant opening, personnel and financial data would be collected and this would continue for the duration of the study.

c. Six months after opening, an initial survey would be done and some observations of the work would take place.

d. Eighteen months after plant opening, a second survey would be made and additional observations completed.

e. Thirty months after plant opening, a third and final survey would be made and additional observations made.

Cost of ISR Research

1. All researcher time will be paid for by a grant from the Department of Labor to the Institute for Social Research.

2. Crown will not be compensated by the grant for any time its employees spend supporting the data gathering aspects of the research, but that kind of time investment will not be great. By far the major time investment in connection with gathering and interpreting data for the research will be borne by the ISR research staff.

3. All data analysis costs will be paid for by the grant.

4. The researchers will provide no direct consulting help as a part of the grant, although they will be responsible for data feedback and interpretation.

CROWN MEDICAL SPECIALTIES COMPANY

WEST COAST

September 25, 1973

Dr. Edward M. Glaser
Human Interaction Research Institute
10889 Wilshire Blvd., Suite 1120
Los Angeles, California 90024

Dear Dr. Glaser:

This letter is to confirm that Crown Medical Specialties Company approves the accuracy of content and spirit contained in your memorandum dated February 21, 1973, on the subject of "Draft Summary of Crown-DOL-HIRI-ISR agreement at meeting on February 9, 1973."

We appreciate Department of Labor funding of support for organizational development consultation and evaluation of our joint effort to arrange the organization and structure of work at our new Centerton plant in accordance with what might be termed "job enrichment" or quality of worklife improvement concepts, with the expectation that this will result in both greater job satisfaction for all concerned, greater productivity, and better product quality than normally is achieved through traditional work arrangements.

Sincerely,

_____PhD
Vice President for Operations

cc: Dr. Robert Foster
Mr._____, Chairman of the Board,
Crown Medical Specialties Company

RESEARCH AGREEMENT

1. The researchers expect to conduct the study over a three-year time period. During this time period two kinds of data will be collected and analyzed.

   A. Data that normally is collected by companies as part of the personnel cost and production management information systems. Such things as absenteeism records, grievance records and turnover records fall into this category. These data will be collected continuously by Crown and given to the researchers.

   B. Data that is collected by the researchers on a periodic basis. This would include attitude surveys and some direct observation of Crown employees. At the present time the expectation is that employees will be surveyed when they first join Crown, 6 months after they join, 18 months after they join, and 30 months after they join.

2. The researchers agree to provide management with feedback about all data collected. The researchers also agree to help management interpret the data and feedback the results to the rest of the organization if this help is desired.

3. Crown will provide access to company records so that the researchers can collect production, cost, and personnel data.

4. Crown agrees to allow the researchers access to its plants and offices so they can observe employee behavior and working conditions.

5. The consultants (HIRI) will allow the researchers to observe and study their interactions with Crown.

6. Crown will allow publication of the scientific reports of the results of the study. Crown will have the right to veto any publication of production and cost information which might endanger their competitive position.

7. A tentative schedule for the research activity is as follows:

   A. The project would be initiated about three months before plant opening. At this time observations of consultant-Crown interactions would begin. This would continue for the duration of the study. All employees would be asked to complete a short questionnaire soon after they are hired. At this time the researchers and management will collabo-

rate in designing an information system for the collection of cost, production, and personnel information.

B. Starting with the plant opening, personnel and financial data would be collected and this would continue for the duration of the study.

C. Six months after opening, an initial survey would be done and some observations of the work would take place.

D. Eighteen months after plant opening, a second survey would be made and additional observations completed.

E. Thirty months after plant opening, a third survey would be made and additional observations made.

APPENDIX B

Guidelines for the Selection of Personnel for a Participative Management Environment

Participative Management Attributes

These lists of attributes are not all inclusive. They have been detailed to assist us in our efforts to obtain employees who can function effectively and comfortably in a participative management type of organization structure.

Attributes for Managerial/Supervisory Employees

Personality Characteristics

1. Maturity

   Manages own emotions and feelings effectively and is aware of and responsive to those of others.

2. Responsibility/Dependability

   Strong sense of loyalty and desire to identify with Crown and the people in its enterprises.

3. Interest in Others

   A genuine interest and respect for the ideas and feelings of others.

4. Open and Supportive

   An ability to create and to work comfortably in an "open" and supportive atmosphere with others which fosters honesty and cooperation.

5. Coach or Coordinator

   The ability to relinquish the traditional "supervisory authority" (boss/director) and assume the role of coach or coordinator, while still retaining the responsibility and authority for effective decision making processes.

Communication Abilities

Above average abilities and skill in communication:

6. Listening

   Attentively and focus attention on others using all input sources--both auditory and visual.

7. Expressive

Active and accurate expression of himself and his ideas as well as those of others.

8. Sensitivity

To the inadequacies of communications and consequent pitfalls.

9. Solicit and Evaluate

Ability to actively seek out the comments and ideas of others, evaluate them accurately and yet not make arbitrary judgments.

Supervisory Abilities

10. Focus

Ability to keep self and others focused on work-related problems.

11. Broad Knowledge and Understanding

One who has (or has the capacity for) an understanding of the various aspects and functions of other departments and how all work together and function as a team--the "what and why" of Quality Control, Quality Assurance, Personnel, Purchasing, Maintenance, etc.

12. Realism

Aware of and with ability to enable employee groups or teams to be aware of external requirements outside their group or team and the restrictions which this can cause. Also, able to help employees find ways to accomplish their goals and work effectively within these boundaries or restrictions.

13. Analytical/Persuasion

One who can effectively take the lead in assisting employees in deciding which course of action to pursue or not to pursue.

14. Action Oriented

Ability and strong desire to act on employee suggestions, help solve problems and facilitate accomplishment of the employees and department's goals.

Physical Characteristics

15. A balance of individuals in terms of age, sex and race.

16. Above average level of energy and physical vigor.

17. Strong--mentally and physically with no physical or emotional problems which would interfere with own or others' work.

18. And finally, a person who can admit mistakes, say "I don't know," but who will find out and try again.

Attributes for Non-Exempt and Production Employees

Personality Characteristics

1. Basic Friendliness--pleasant manner

2. Flexibility--Willingness and desire to learn and try new ways of doing things.

3. Maturity-- Manage own emotions and feelings effectively with awareness of those of others.

4. High Sociability--Enjoys working as a member of a team and via group accomplishment.

Physical Characteristics

5. A balance in terms of age, sex and race.

6. Health/Well Being--Good level of energy and vigor. No physical or emotional problems that would interfere with own or others' work.

Aptitudes and Abilities

7. Adequate intelligence, special aptitudes and skills required by work assignments.

8. Good social communications skills, both in self-expression and ability to focus attention (visual and auditory) on others.

Work Related Attributes

9. Desire to learn and progress.

10. Willingness and desire to assume responsibility. Realization that work is both give and take, not all "take."

11. Dependability--Can be counted on to carry out assigned tasks

12. Willingness and ability to work rotating shifts and exert extra effort when required.

APPENDIX C

Tasks, Projects for P-O's Involvement at C/C from 5/16/74

1. Participant-Observation of teams in Production, QA, Maintenance and other areas

   --Understanding of task requirements

   --Develop a description of communication, team style of operating, team leadership style

   --Provide feedback to team

   --Provide some information about team activity and general functioning to management

   --Develop a description of organization climate or worklife from perspective of the individual

2. Team training, participative management, job enrichment training in maintenance department

3. Assist development of new supervisors' training program

4. Preparation of the group record from first training sessions (3-4-74)

5. Third party role in problem-solving situations

6. Follow-up on individual development conferences

7. Team meetings without supervisors for feedback

8. Develop measures of team activity level and grievances or problems

9. Develop expectations or policy for frequency of team meetings (and records of them)

CROWN MEDICAL SPECIALTIES COMPANY

Memorandum

From: Personnel Manager

Date: 5-22-74

Subject: Consultant Activity Related to our Centerton Plant "Quality of Life at Work" Program

---

To update you on the above subject, Mary Faeth Chenery joined us on May 16 and plans to work with us full-time this summer, as a representative of our consultants (The Human Interaction Research Institute). She will work with Managers, Supervisors, and employees. Some of her specific assignments will be:

1. To work with and assist Managers, Supervisors, and employee teams in Production, QA, Maintenance and other areas.

2. To observe and learn what our various jobs are.

3. To assist in Team Training and development.

4. To assist in developing and conducting new supervisor's training programs and on-going training programs.

5. To develop measures of and recording of Team activity and employee problems, and to assist in problem solving.

Mary Faeth will be located in and will work out of Production, QA, etc., as her activities require. She is here to help us, so contact her as required.

Cal Izard will be here on Monday, May 27. His first two days will be pretty well taken up with conducting developmental counseling interviews with supervisors (see attached schedule). If any of you need to spend some time with Cal, please check with him.

Drs. Ed Glaser and Ed Lawler, and Gary Herline (ISR-University of Michigan) and a representative of the U.S. Department of Labor Office of Research and Development will be visiting the plant on Wednesday, May 29th for an on-site progress review and evaluation of our Centerton "Quality of Life at Work" program.

APPENDIX D

Summary Description of QWL Program
August 1974

(Distributed to C/C managers and supervisors in August 1974, and to all personnel hired thereafter.)

HUMAN INTERACTION RESEARCH INSTITUTE
(HIRI)
Los Angeles, California 90024

Quality of Worklife Program -- Centerton Plant

WHAT DOES QUALITY OF WORKLIFE MEAN?

Quality of Worklife pertains to all aspects of life at work, including job content, working conditions, supervisory and management relationships, organization structure, and so forth.

More specifically for us, it means deliberate efforts which are made to try to create kinds of jobs and the kinds of working relationships which will be meaningful and which will result in high motivation and high productivity of all employees in an open and enjoyable work situation.

A high Quality of Worklife would probably mean:

: Open Communications
: Good interpersonal relationships between managers, supervisors, and employees
: Varied and challenging jobs
: Employee involvement in problem-solving and input into decisions which will affect them
: High individual and team responsibility
: Freedom for individual initiative and advancement
: A fair system of pay and benefits
: Openness to change and to new ideas

HOW DID CROWN GET INVOLVED IN THIS PROGRAM?

On the basis of a presentation by Edward Glaser & Associates to Crown management regarding successful experiences of other companies which have tried innovative Quality of Worklife programs, Crown decided to design the C/C plant to operate along these lines.

WHAT IS THE "PROJECT" PART OF THIS PROGRAM?	After Crown decided to structure the C/C plant according to Quality of Worklife ideas, the U.S. Department of Labor agreed to fund a research and demonstration project, to be carried out by the Human Interaction Research Institute (HIRI) of Los Angeles. HIRI's responsibility in the project is to provide consulting assistance to Centerton in its development of that type of work structure, and to investigate its relationship to productivity and job satisfaction. The project's present title is "Collaboration of Management and Employees in the Organization and Structure of the Work."
WHO IS INVOLVED?	Consulting assistance is provided to Centerton by the Human Interaction Research Institute (HIRI) of Los Angeles, through Drs. Ed Glaser and Cal Izard, and Mary Faeth Chenery. Independent evaluation of the process and outcomes of this research and development project is being carried out under another U.S. Department of Labor grant by the Institute for Social Research (ISR) of the University of Michigan through Ronie Nieva, Dennis Perkins, Ed Lawler, and others.
WHAT IS BEING DONE?	Consultants work with the plant manager, personnel manager, and other managers and supervisors on team training, supervisory training, development of organization and work structure, development of an open atmosphere and a participative management philosophy and style of operation. Managers and supervisors take this way of operation --openness to suggestion, group problem-solving, team participation in policies and other important concerns--to employees. Cal Izard, who started the program off, is currently on a Scientific Exchange visit to Russia until January 1975. Ed Glaser visits the plant periodically. Mary Faeth Chenery is here at the plant to provide on-going consultation and assistance with individuals and groups as requested and to keep a history of how we are developing.
WHY A RESEARCH PROJECT?	Through the formal study of a research project, Crown, HIRI, ISR, and the U.S. Department of Labor hope to gain a better understanding of how to improve the quality of life at work, how to make the time that people spend at work more than "just a job," to make worklife more meaningful and satisfy-

ing for employees, and how these aspects of work affect productivity. As more knowledge is gained, HIRI and the Department of Labor expect to make this information available publicly so that others may benefit from Crown's experience.

The Department of Labor is very interested in finding ways to improve the rate of productivity; and they believe that changing the quality of life at work may be one way to affect productivity. Improving productivity is one important way to try to stop the destructively high rate of inflation in our economy.

HOW LONG WILL THIS GO ON?

Centerton is committed to operate according to the principles of Quality of Worklife Improvement, changing as time and experience bring new needs and new ways to achieve better organizational effectiveness.

The consultants (HIRI) will be around to help probably for another year. Mary Faeth Chenery plans to be at Centerton for at least another five or six months and perhaps until June, 1975.

The Institute for Social Research will continue to gather data for another year, though perhaps less and less frequently.

MORE QUESTIONS?

If you have more questions about the research or the Quality of Worklife Program as we are trying to implement it at Centerton, please ask your supervisor, anyone in Personnel, or Mary Faeth Chenery.

APPENDIX E

Crown/Centerton Quality of Worklife Goals

---

1. PARTICIPATIVE MANAGEMENT

"A style of management that invites participation or consultation from appropriate members of the workforce on matters which affect them and with regard to which they have some relevant input...It is this style that tends to increase the psychological meaningfulness of work."

a. Participation invited, encouraged, and rewarded in matters (such as policy formulation, staffing, work arrangements, problem-solving) that affect the employees.

b. Openness to consideration of change (i.e., honest listening)

c. Explanation given on reasons for requests or decisions (people are told "why")

d. Prompt and considered response given to each contribution (question, suggestion, problem)

e. Periodic reviews of organization and task performance effectiveness and progress toward goals are held.

---

2. OPEN, THOROUGH, TIMELY TWO-WAY COMMUNICATION

a. Employees well-informed about company's products, events, policies, problems, achievements

b. Regular and frequent opportunities provided for information exchange, critique, and problem-solving (e.g., staff meetings, regular team meetings, shift change); continual openness to and invitation of criticism, question, challenge, and suggestion

c. Feedback given about an individual's or task-team's performance--informally: prompt, specific, and frequent; formally: by timely use of the performance review system

2. OPEN, THOROUGH, TIMELY TWO-WAY COMMUNICATION (continued)	d. Production feedback system developed and implemented (feedback from the job itself) e. Written documentation of goals, plans, agreements, etc., to facilitate clarity, a common understanding, and follow-up.
3. MEANINGFUL JOBS	a. Small work teams used when practicable; jobs involve production of whole or substantial part of product (not a tiny fragment) b. Challenge and a variety of skills called for c. Some autonomy and responsibility for individuals and teams d. Individuals receive feedback on their performance from the job itself e. Opportunity for advancement and learning f. Adequate technical training g. An appropriate amount of work h. Clean, safe environment with fair pay and benefits

APPENDIX F

Comments from P-O's Interviews with C/C Personnel (April 1975)

Comments About How Centerton Differs from Other Workplaces

--more freedom

--more people-oriented

--participation of managers and supervisors and sometimes employees in policy setting

--closer relationships, more friendly, we work together

--higher calibre people, more technically competent; relationships are built on the basis of competence rather than personality

--a physical facility well-thought-out and well cared-for

--the sense of urgency plus the freedom to express oneself (meaning you can walk into anyone's office anytime) makes the company very results-oriented. That's appealing.

--the fact that the Quality of Worklife project is here at all . . .

Comments about the Organization in General or Management (Direct quotations or paraphrases)

Centerton (C/C) is a very young organization (in management skills) but receptive.

The general atmosphere is not as open as had been expected.

There were confused expectations about one person making a decision--some complain that you have to call five people to make one decision, plus they feel that the plant manager makes decisions where others don't want him to . . .

In the past there has been a misunderstanding that people should participate in everything.

C/C is good at problem identification, not so at problem-solving or commitment to implement or followup; part of the problem here was overemphasis on individuality (therefore people didn't feel

they had to support solutions). There has been a lack of quick followup when a commitment was not kept.

I question what commitment C/C has to participative management (PM).

Listening skills are needed.

What is need among managers, super-technicians or basic administrators?

Roles and relationships between production and the service departments are clouded at times; we need relationships not meetings.

There are too many people at some meetings when they should be there for only part if at all.

Real communications just don't get to the right people.

The PM style and QWL efforts are seen as a hassle by some managers, but the people seem to respond to it.

"Distrust comes when a manager doesn't share his inner feelings. Then a change comes and you don't know why--whether it was something you did or what. There's a need to get close to people so you know."

They set the goals too high when they opened the plant . . .

Recommendations Regarding the Quality of Worklife (And Organization Effectiveness)

1. The quality of Worklife efforts at C/C need to lose their status as a project and become an integral part of the Centerton plant operation.

2. HIRI should collaborate with the personnel manager et al. to develop a method evaluating the QWL in the future (e.g., a semi-annual QWL Audit) and to develop a training program (managerial, supervisory, and employee) in light of the learning from this project.

3. In general, managers and supervisors need to be more methodical in what is done, to push beyond the problem to a plan and action steps.

   a. Beyond just eliciting participation from employees, such participation should be rewarded (in feedback and performance reviews), and a response to the participation (be it question, suggestion, or problem) should occur in a timely and thorough way.

b. Training, modeling, and practice in meeting leadership and problem-solving should be provided.

c. In information-sharing, accuracy needs to be emphasized, and perhaps some training about perception differences needs to be part of orientation. I have noticed a tendency among people to exaggerate and have found that this exacerbates inter-departmental difficulties.

4. More frequent, more specific, and more timely feedback about people's performance needs to be given. Supervisory training in evaluation, review, and feedback is recommended.

5. Openness to criticism is a matter of modeling on the part of managers and supervisors. The staff and supervisors need to work with employees to let go of the past and concentrate on new needs and new solutions. I would recommend that managers and supervisors make an effort to seek feedback from others, until it becomes a natural exchange.

6. More news of events in other areas of the plant and of corporate happenings is needed in each department. This should be provided through the representative meetings, supervisor reports, inter-departmental exchanges, or other channels devised.

   a. A sales representative should come to the plant to discuss with each group the use of the products and marketing affairs.

   b. Whenever possible, interdepartmental exchange of members should be encouraged, primarily for training purposes, but with the secondary intentions of enriching the variety, challenge, and breadth of the individuals' jobs and especially increasing the understanding between departments of the various functions and problems, as well as what help can be given to the other. (Discuss with QA the similar exchange already conducted between the bio and chem labs.)

7. Discuss, clarify, and agree upon the roles of the service departments (QA, Accounting, and Personnel, plus Maintenance) in relation to production.

8. Arrange supervisors' meetings across departments for exchange of perceptions and experience (to increase understanding), and later as a forum for training.

9. Effective use of good job design principles will do much for improving and maintaining a good quality of working life at Centerton. In the future, each manager should be responsible

for evaluating, creating, and maintaining meaningful jobs. Review of job content and design should be part of the QWL Audit. In the long run, new jobs created should perhaps be reviewed by the staff or another knowledgeable group for "motivating potential" or good design.

I believe that the Centerton management group should feel reinforced by this report in the job that is being done to create a good working environment. You should perhaps note as well, however, that you may be on the edge of becoming more concerned "about money and machines than people," and should support, encourage, and renew efforts to insure participation, communication, and meaningful work.

APPENDIX G

BIOGRAPHICAL RESUME OF CARROLL E. IZARD

Dr. Izard is a clinical psychologist and Professor of Psychology at Vanderbilt University. He has been involved in the area of human resources development since 1955.

In addition to his teaching responsibilities at Vanderbilt, Dr. Izard has been Director of the Psychological and Counseling Center (an inter-university center, with Peabody College) since 1968. He has been a member of the Vanderbilt University Afro-American Affairs Committee since 1969. He also has served as Director of the University Counseling Center, Director of the Clinical Training Program, and Chairman of the Race Relations Committee.

Dr. Izard received his Phd from Syracuse University in 1952. After completing his PhD studies, he worked for three years as a research associate, first at Tulane University and later at Research Associates, Inc. of Philadephia. From 1955-56 he was a Specialist in Individual Development and Human Relations with the General Electric Corporation.

He has published numerous professional articles and books, a selected sample of which is listed below. He holds a Diplomate in Clinical Psychology, ABEPP. He is a Fellow of the American Psychological Association, Editor of the Tennessee Psychologist, member of the Southeastern Psychological Association, past president of the Tennessee Psychological Association, past chairman of the Finance Committee and Tennessee Delegate for the AASPB, and past member of the Tennessee Board of Examiners in Psychology.

Selected Sample of Publications:

a. The face of emotion. New York: Appleton-Century-Crofts, 1971.

b. On understanding and promoting human effectiveness. ONR 2149 (03) NR 171-609 Technical Report No. 29, Vanderbilt University, 1966; also in The Human Context, in press.

c. Personality characteristics associated with resistance to change. Journal of Consulting Psychology, 1960, 24, 437-440.

d. Prediction of peer leadership ratings by forced-choice test under varied experimental conditions. Educational and Psychological Measurement, 1958, 18, 57-62 (with N. Rosenberg).

e. Personality characteristics (PPS), level of expectation, and performance. Journal of Consulting Psychology, 1962, 26, 394.

f. The emotions and emotion concepts in personality and culture research. In R.B. Cattell (Ed.) Handbook of modern personality theory. Chicago: Aldine, 1970.

g. A method for measuring interpersonal perceptions and feelings. ONR 2149 (03) NR 171-609 Technical Report No. 9, Vanderbilt University, 1962. American Psychologist, 1962, 17, 360 (abstract).

h. The effects of spontaneous and experimenter-induced affect on performance. ONR 2149 (03) NR 171-609 Technical Report No. 24, Vanderbilt University, 1965 (with M. Katahn, R. Murphey, and J. Fox).

i. Personality profile similarity as a function of group membership. Journal of Abnormal and Social Psychology, 1963, 67, 404-408.

j. Fundamental emotions involved in black-white encounters characterized by race prejudice. Proceedings of the American Psychological Association, 1970 (with J.E. Chappell and F. Weaver).

Consulting Orientation

My principal focus is on human emotions and their role in motivation, personality, and social interaction. In consultative work, I try to be especially sensitive to emotional barriers to interpersonal and group communication.

In attempting to develop the team concept as a means of implementing QWL principles, I concentrated on the development of an atmosphere in which honest, open communication could occur without penalty. I assumed problem- and task-centeredness on the part of technicians, supervisors, and managers, and dealt less with the technical elements of their interchanges and more with the "human" aspects of their participation. While stressing the positive values of wide participation in group problem solving and decision making, I attempted to recognize and facilitate the development and acceptance of adequate organization and leadership within the teams.

BIOGRAPHICAL RESUMÉ OF MARY FAETH CHENERY

Mary Faeth Chenery has been involved in the areas of management and organizational development since 1972.

From 1972-73, she served as a Graduate Teaching Assistant at the Babcock Graduate School of Management, where she taught courses in Creativity and Interpersonal Skills in Management. During this time period, she also worked as a management consultant for a summer camp. In 1974, she deisgned and with several colleagues taught a 5-month graduate seminar in Organizational Development at Vanderbilt University.

Ms. Chenery received the A.B. (cum laude) in General Studies from Harvard University in 1971; in 1973 she was awarded a Master's degree (with Distinction) from Babcock Graduate School of Management, Wake Forest University. She currently is a doctoral candidate at North Carolina State University, working toward a PhD in Human Resource Development.

Publications:

a. The self-start attitude: New attention to the goals of camping. Social Agency Management (in press).

b. A counselor's companion to the staff manual. Camping Magazine (in press).

Consulting Orientation

My actions as participant-observer were guided by the belief that organizational change depends upon the willingness of organization personnel to take risks--generally small risks in communicating and in trying out new behaviors. The consultant's role in facilitating change then is to model such risk-taking behaviors, help clarify the nature of the risks, suggest strategies to make the risks manageable, and point out the gains to be made from taking them. For continued development, organization members must begin to take risks publicly (that is, leadership must be expressed).

I believe it is of great importance in organization development for leaders to write down and clarify philosophies and goals. Structure must combine with good intentions and philosophies in order to achieve goals.

My actions are strongly grounded in a respect for individual choice, which meant in this experience a somewhat non-assertive role. My understanding of the participant-observer role also called for a fairly unobtrusive style, definitely not a leadership or advocate position. This emphasis was, of course, influenced by the lack of organizational power in support of the consulting intervention.

BIOGRAPHICAL RESUMÉ OF EDWARD M. GLASER

Dr. Glaser is a consulting psychologist and has been engaged in human resources development since 1946.

In 1952 he established his own national firm of psychological consultants to management--Edward Glaser & Associates. The firm's main office is located in Los Angeles. Dr. Glaser also is president of the Human Interaction Research Institute, a nonprofit, multi-disciplinary institute devoted to behavioral science research and the application of research findings to relevant societal problems. Dr. Glaser also is Adjunct Professor, Union Graduate School, Antioch College, Yellow Springs, Ohio.

Dr. Glaser received his PhD from Columbia University in 1940. While completing his graduate work, he taught psychology and served as Principal Investigator for the Committee on Medical Jurisprudence of the New York Academy of Medicine in their study of legal procedures and problems connected with assessment of the criminally insane in New York State.

During the war, Dr. Glaser served as a Classification and Selection Officer in the Navy (Lt. Cdr.). Prior to his naval service, he was a psychologist with the U.S. Public Health Service, doing research and psychotherapy with special problem cases at a federal reformatory.

He has published numerous professional articles, a selected sample of which is listed below. He holds a Diplomate in Industrial-Organizational Psychology, is a past president of the Southern California Psychological Association, past chairman of the APA Ethics Committee, has been chairman of the California State Psychology Examining Committee, and is a past president of the Division of Consulting Psychology, American Psychological Association. He is a Fellow of the American Association for the Advancement of Science and of the American Psychological Association. In March 1967, he was invited to testify on research utilization before the Senate Subcommittee on Government Research.

Consulting Orientation

My basic professional training was in clinical and social psychology. I have been functioning as a psychological consultant to organizations since 1946 (in addition to my research work).

In working with a client organization, I tend to focus first on learning who really is my client--who is seeking my consultation, for what and whose purposes, etc. Thus, I attempt to assess "learning readiness." If I have questions about whether the client is asking the "right" questions, we explore such considerations. While I try to work closely with the persons who have the power to decide what may or may not be attempted, my consultation often extends to individuals or groups at the lower levels of the organization. Usually, this can be carried on only through the consultant having good access to those above them in the organizational hierarchy.

What I do depends in large part on (a) the client's perception of needs, (b) my assessment of the client's needs, and (c) my own areas of consulting capability. From this "joint venture" exploration, we develop a consultation service plan. I try to get the client to look with me at questions of leadership, goals, decision making, motivation, communication and control as they affect organizational performance, goal attainment, job satisfaction, and QWL. Or to put this in another way, an objective of consultation is to help the client organization look diagnostically at itself and validate its state of being as OK, or identify areas in need of remedial action, then serve as a resource for planning and taking remedial action.

A key concept in my mind that bears on organizational effectiveness and QWL is the general desirability of creating a responsive work climate wherein suggestions from any level for improvement in the design, structure, organization or modus operandi of the work or work setting readily can arise and receive serious, non-defensive, respectful attention. From such a work culture, desires for greater participation in decision making, job enrichment or improved reward structure can emerge.

APPENDIX H

INTERVENTION FOCAL POINT	INTERVENTION	ACTUAL OUTCOME	ASSESSMENT
Meaningful jobs- rotation, challenge, some autonomy, responsibility, feedback, influence on job design. DESIRED OUTCOME	5-21-75 Suggested various alternatives to finishing supervisor, re: finishing jobs--e.g., team members assigning positions for finishing; using volunteers for the fill; informing members early so to involve in problem solving. Also feedback on lack of rotation in fill jobs.	5-21-75 Initial response was that he feels he has little choice (authority or ability to influence) in job design (dept. manager appears to be the decision-maker). 5-22-75 Some rotation occurred--dependent on supervisor's assignment.	5-25-75 Would be good if next fills could have rotation dependent on operator preference & negotiation.
	5-21-75 Asked dept. manager about job changes.	5-21-75 Dept. manager said some changes were only dependent on (awaiting) supervisors writing the job description.	
	5-27-75 Gave feedback to supervisors that dept. manager had differing perceptions of next step.		
VALUE OF OUTCOME Ref: Theoretical Framework	5-28-75 Gave feedback to plant manager that some operators want more opportunities to think; feedback resulting from comments such as, "they don't give us credit for having the intelligence to get from home to work;" or, "if they're so busy, why not let us do some of those jobs?"	5-28-75 Plant manager commented that he wants that feedback to come to him in the employee representative meetings, then he can use it with the managers. 5-26, 5-28-75 Both personnel manager and plant manager see it wa their responsibility to intervene and/or influence the way jobs are designed--that if a dept. tried to create an isolating or boring job they would question.	

APPENDIX H (Continued)

INTERVENTION FOCAL POINT	INTERVENTION	ACTUAL OUTCOME	ASSESSMENT
DESIRED OUTCOME	6-11-75 Referring to 5-21-75: went to finishing supervisor, asked what advantages of consulting people before restructuring jobs--suggested (1) new ideas, alternatives, (2) better acceptance.	6-11-75 Response was vague; saw disadvantage of getting people's hopes up then not being able to change. Then said no change was planned and that people had expected to fill when hired as finishing operators. Then couldn't remember if he'd told operators in hiring them . . .	6-11-75 Felt he was confused and changing his story.
		6-11-75 later: the supervisor called to tell me that he felt he'd "copped out" on me in our previous conversation--that I hadn't gotten his attention--and he apologized. Sorry he hadn't told me at the time.	6-11-75 Very frustrating --this supervisor is self-aware but doesn't operate in real time. Means too that he's not "with" his operators at times.
VALUE OF OUTCOME Ref: Theoretical Framework	6-11-75 I encouraged one team member to discuss this with supervisor and, with his agreement, to discuss with dept. manager.	6-11-75 Finishing dept. manager and supervisor agreed that the morning's task would be to work with dept. manager and QA to set a standard for glass rejects. What happened was that dept. manager sent QA away (to release needed stoppers), then dept. manager set standard with supervisor, not people (who do the inspecting). Then supervisor related standards to team--without explanation for why QA left or why plan was changed.	6-11-75 This situation is fairly typical, reflects managers' attitude that production must not stop and that chain of command is only vehicle needed. Won't take time to communicate.

APPENDIX I

OUTLINE OF AN EVALUATION PROCEDURE*

An organization about to embark upon a quality of work program that it hopes also would improve productivity in the process, needs to measure the results of its efforts. It also would be well to assess systematically the "readiness" of the organization to make such a change and carry it through successfully.

Dr. Howard R. Davis, Chief, Mental Health Services Development Branch, National Institute of Mental Health (NIMH), Rockville, Maryland, has developed a model for understanding what appear to be the principal factors underlying change in human systems, using the acronym A VICTORY. It is based on the principle of synergism--the force of relevant factors working together. Among the several uses to which the model may be put are determining: (1) the readiness of a given system or organization to adopt a specified change, and (2) the "weak links" among the eight factors that may need strengthening before launching into the change efforts *per se*.

The A VICTORY formulation evolved from a behavioral model of change adapted from learning theory embracing such considerations as drive or motivation, the ability or capacity of the learner, and circumstances or stimulus conditions. Results from a number of experiments on adoption of innovations, as well as from literature surveys, have been matched with the behavioral factors.

The factors, or elements, of this model are defined briefly as follows:

(a) Ability - required capability to adopt the innovation: sanctions; fiscal, manpower, physical resources; freedom from overweening competing demands.

(b) Values - the nature of the innovation: values implicit in its adoption, both typically, and from the standpoint of organizational attributes relevant to its success, such as compatibility with the value system of decision-makers in a given situation.

(c) Information - clarity and communication qualities of the innovation; information relevant to understanding how the innovation will help solve a problem.

---

*Portions of this brief summary were excerpted from H. R. Davis & S. E. Salasin, "The Utilization of Evaluation." In B. Struening & M. Guttentag, Eds., Handbook of Evaluation Research, Vol. I (Beverly Hills, Calif.: Sage Publications, 1975).

(d) Circumstances - stimulus conditions or environmental features of events relevant to the success of the project; prevailing factors pressing for or detracting from certain actions.

(e) Timing - of critical phases or events relevant to the innovation; synchrony with other significant events.

(f) Obligation - awareness and felt need to do something about a problem that the innovation seems likely to solve.

(g) Resistances - inhibitors of the change, rational and irrational; perceived risks if the specific action is taken.

(h) Yield - the benefits or payoff from the innovation as perceived by potential adopters and by program participants.

The content under each of the factors appearing in the preceding outline and the profile rating to follow is based upon distillations of much of the literature on knowledge utilization and organizational change as deemed to pertain to human services. The generation of A VICTORY also has been dependent upon a series of conferences and experimental studies over the past ten years supported largely through NIMH in-house resources, contracts, and collaborative grants. Extensive help has been provided by consultants working in the field of change outside the topical area of mental health. The A VICTORY technique, in its several developing stages, has been applied in technical assistance and in research consultation and administration within the services program at NIMH. It also has had continual use as an internal management approach within that program.

Based on a series of collaborative studies underway and sponsored by NIMH, it seems fair to conclude at this point that the A VICTORY technique may at least offer a starting framework for planning the adoption of new policies or practices.

In order to focus attention on the A VICTORY factors and to make explicit in profile form the outcome of the judgments of interested persons, the following rating scheme may be useful:

A VICTORY Profile

	Factor	Rating of Factors*										
		0	1	2	3	4	5	6	7	8	9	10
Ability	Are staff skills and knowledge appropriate to accommodate the change?	.	.	.	.	.	.	.	.	.	.	.
	Are fiscal resources adequate for the desired change?	.	.	.	.	.	.	.	.	.	.	.
	Are physical resources appropriate and adequate for the change?	.	.	.	.	.	.	.	.	.	.	.
	Are the necessary managerial skills available to accomplish the change?	.	.	.	.	.	.	.	.	.	.	.
Values	Is the change consonant with relevant values of clients, such as perhaps social, religious, ethnic or political values?	.	.	.	.	.	.	.	.	.	.	.
	Is the change consonant with the philosophies and policies of program supporters?	.	.	.	.	.	.	.	.	.	.	.
	Is the change consonant with the personal and professional values of the staff?	.	.	.	.	.	.	.	.	.	.	.
	Is the change consonant with the personal and professional values of the top man?	.	.	.	.	.	.	.	.	.	.	.
	Are the characteristics of the organization such as to render change likely?	.	.	.	.	.	.	.	.	.	.	.

* Key to Rating

0 = complete absence, or poor fit, or deeply negative answer to the question raised under the particular factor

5 = a midpoint rating

10 = an exceedingly positive or "resounding yes" to the question raised under the particular factor

Ratings intermediate between the above points may be assigned according to the rater's judgment as to where the organization falls with respect to each factor.

	Factor	Rating of Factors										
		0	1	2	3	4	5	6	7	8	9	10
Information	Is information regarding the desired change adequate and clear?	.	.	.	.	.	.	.	.	.	.	.
	Does available information about the idea bear relevance to the seemingly needed improvement?	.	.	.	.	.	.	.	.	.	.	.
	Does available information indicate that the idea behind the desired change is "tryable;" can its alleged advantages be demonstrated and observed?	.	.	.	.	.	.	.	.	.	.	.
	Have the possible negative side effects been surfaced with appropriate conditions of optimal use specified?	.	.	.	.	.	.	.	.	.	.	.
Circumstances	Are conditions in the potential adopter's situation similar to those where the idea was demonstrated to be effective?	.	.	.	.	.	.	.	.	.	.	.
	Does the organization appear to be in a condition or mood of "readiness" for the given change?	.	.	.	.	.	.	.	.	.	.	.
	Is the organization located near facilities or community services that may be needed to help implement the change?	.	.	.	.	.	.	.	.	.	.	.
Timing	Should the change be implemented now or will the organization be in a better position to do this successfully sometime in the future?	.	.	.	.	.	.	.	.	.	.	.
	Is the suggested improvement likely to continue to be of value or might it become outdated in the near future?	.	.	.	.	.	.	.	.	.	.	.
	Are other events occurring at this time that could bear on the response to this change?											

	Factor	Rating of Factors										
		0	1	2	3	4	5	6	7	8	9	10
Obligations	Has the need for this change been ascertained through sound evaluation?	.	.	.	.	.	.	.	.	.	.	.
	Has the need for this change been compared with other needs in the program?	.	.	.	.	.	.	.	.	.	.	.
	Are there other strong reasons--political, administrative, fiscal or powerful/influential advocacy--pushing for the change?	.	.	.	.	.	.	.	.	.	.	.
Resistances	Have all the reasons for not adopting this change been considered at least by all key persons concerned?	.	.	.	.	.	.	.	.	.	.	.
	Has consideration been given to what may have to be abandoned if the plan is implemented?	.	.	.	.	.	.	.	.	.	.	.
	Has consideration been given to who will lose in this change?	.	.	.	.	.	.	.	.	.	.	.
	Has consideration been given to possible unrealistic staff resistances to the change; can these be overcome satisfactorily?	.	.	.	.	.	.	.	.	.	.	.
Yield	Has the soundness of evidence about the potential benefits of the plan in comparison with present or alternative plans been carefully assessed and made available to those concerned?	.	.	.	.	.	.	.	.	.	.	.
	Have possible indirect rewards for this change been examined and communicated appropriately?	.	.	.	.	.	.	.	.	.	.	.

ABSTRACT: IN ORDER TO INTRODUCE CAREER GUIDANCE CONCEPTS INTO THE REGULAR SCHOOL PROGRAM, THIS PROJECT DEVELOPED A MODEL FOR LOCALLY-BASED CAREER EDUCATION INFUSION. A WEEK-LONG WORKSHOP WAS HELD AT THREE DIFFERENT SITES FOR REPRESENTATIVES FROM ELEMENTARY, MIDDLE SCHOOL, AND SECONDARY LEVELS, AND COUNSELORS AND ADMINISTRATORS. THE PURPOSE WAS TO CREATE A DISTRICT-WIDE AWARENESS FOR MORE EFFECTIVE INFUSION OF CAREER EDUCATION INTO THE REGULAR CURRICULUM. INCLUDED IN THIS REPORT IS THE MODEL, BRIEF NARRATIVE SUMMARY OF ACTIVITIES, WORKSHOP PLANNING PROCEDURES, SCHEDULES, WORKSHOP SITE SELECTION CRITERIA, PARTICIPANT INFORMATION SHEETS, LISTING OF MATERIALS AND BOOKS USED, EVALUATION AND FOLLOWUP FORMS, AND SOME OF THE MATERIALS DEVELOPED BY THE STAFF FOR PILOT TESTING. Narrative Description of Activity

To achieve an infiltration of Career Guidance concepts into the regular school program, a series of activities needs to be presented to representative members from all levels in an educational system. One or two people cannot decide to make a change and have any assurance that that change will come about on a district-wide level. There must be total representation in order to facilitate change with continuity of purpose.

This project, known as the Locally Based Career Education Infusion Model for Inservice Education, attempted to create a district-wide awareness by seeking representatives from elementary, middle school, and secondary levels as well as counselors and administrators to attend a week-long workshop.

The activities listed on the Workshop Schedule were carried out at three different sites of varying sizes:

Forrest* - District population less than 1,000 students
Newton - District population between 1,000 and 2,500 students
Decatur - District population over 2,500 students

At the conclusion of each workshop various program plans had been formulated. There was a district plan, an attendance center plan, and often even individual plans had emerged.

* Fairbury-Cropsey School District was asked to join the small school site.

Workshop Planning Procedures

1. Announce workshop.

2. Begin communication with interested districts.

3. Arrange to offer university credit.

4. Review existing career guidance materials and collect possible materials to be included in workshop program.

5. Compose the following forms:
   --Workshop Application
   --Participant Information
   --Criteria for site selection

6. Select and notify workshop sites.

7. Select books and materials to be distributed at workshop sites.

8. Develop the following materials:
   --Workshop format and schedule
   --Workshop materials
   --Workshop evaluation
   --Follow-up evaluation

9. Duplicate materials in numbers needed.

10. Organize panel discussion format and contact local people at workshop site to arrange participation.

11. Visit the workshop sites to make initial preparations and to determine local needs of district.

12. Determine and arrange for physical facilities for operation of workshop.

13. Send news releases to schools for inclusion in local newspapers.

14. Determine the weekly format.

15. Provide material to news media describing week-long activities.

Criteria for Choosing
Workshop Sites

School District _____ Site A Site B Site C

The following items will be considered carefully as each site is being considered as a location for the workshop.

	Strongly Agree	Agree	Do Not Agree
1. There is evidence that the decision to be a Workshop Site was decided by more than the administration. (Application).			
2. From information gleaned, this school district would benefit from such a workshop. (Regional Superintendent or Regional Vocational Director).			
3. Evidence has been shown that an effort is being made at this time in the district to develop a program infusing career concepts. (Regional Superintendent, Regional Vocational Director, Selected School Personnel).			
4. This school district is known for its willingness to make changes if it is for the good of the students. (Regional Superintendent, Regional Vocational Director).			
5. The school district has shown interest in involving the community in its plan for building its curriculum. (Application).			
6. A similar workshop has not been conducted at the school site before so that concern need not be made of duplication. (Application).			
7. The school district is within a reasonable distance for staff travel. (Map).	0-50	50-100	100+
8. The applicant meets the requirements for being a K-12 district or the district has made arrangements for including feeder schools so that it meets the K-12 requirements. (Application).			
9. There have been indications that participants will be administrators, counselors, high school teachers, junior high teachers, and elementary teachers. (Application).			
10. The contacts made with the prospective school district have been warm and show a vital interest and a spontaneous excitement for producing a workable K-12 career guidance program. (Correspondence and phone calls).			
11. A participant has been solicited from business and industry. (Application).

List all part-time jobs (those not listed as full-time above) you have held during your lifetime:

LOCAL ARRANGEMENTS

Physical Facilities

1. 2 rooms in close proximity (preferably air conditioned).
   - one room should be the main meeting room with chairs and tables for total number of participants.
   - one room with tables and chairs for at least half the total number of participants

2. A.V. Equipment
   - overhead projector
   - screen
   - extension cord with adapter (if needed)

3. Lecturn

4. Portable chalk board and eraser

5. Beverage station (preferably in main room)
   - coffee (might help to have an official "coffee maker")
   - soft drinks

Arrangements:

1. Lunch meeting for workshop staff and administrators on Wednesday to plan strategies for Thursday and Friday's planning sessions. Please invite these people even if they are not at workshop:
   Superintendent and/or
   Assistant Superintendent
   Principals
   Vocational Director(s)
   Counselor(s)
   We would encourage them to be present on Thursday and Friday if at all possible to be resource people during the planning phase.

2. Arrange with local newspaper to take picture of workshop participants on Monday morning at 9:00 a.m. and/or on Thursday at 9:30 A.M. when community panel is present. (A news release will be available from workshop staff).

Thank you so much!

WORKSHOP SCHEDULE

MONDAY	TUESDAY	WEDNESDAY	THURSDAY		FRIDAY
9:00-12:00	9:00-12:00	9:00-12:00	9:00-12:00		9:00-12:00
- Get Acquainted - Overview of Workshop - Planning a Career Guidance Program	- Needs Assessment: How well are goals being met? - Needs Assessment Model	- Evaluating Career Guidance Programs - Implementation Approaches for a Curriculum-Based Career Guidance Program	- Material Display All Day - Community Panel - District Planning and Development	- Establishing Objectives for a Comprehensive Job Placement Program - A Comprehensive view of a Job Placement Program	- Continual Material Display - Continue Planning and Development
1:00-3:00	1:00-3:00	1:00-3:00	1:00-3:00		1:00-3:00
Establishing Goals For a Comprehensive Career Guidance System	First Steps in Designing a Career Guidance Program	Applying Curriculum Based Career Guidance Approaches to a School Setting	Continue Planning and Developing	Determing a Job Placement Program Plan of Action	- Presentation of Program Overview and Plans for District Development and Implementation - Workshop Evaluation

The following Books and Materials were presented to each of the four participating school districts:

How to Plan a Community Resources Workshop

Career Education & The Curriculum, Monograph Series IX

Career Guidance Practices for Disadvantaged Youth

Bread & Butterflies (Teacher's Manual)

Career Education and the Elementary School Teacher

Career Education in the Middle/Junior High School

Career Education in the Academic Classroom

Career Education for Gifted and Talented Students

Career Education Survival Manual

Olympus Career Education Needs Assessment Instruments

Career Education Resource Guide

Career Survival Skills Teacher's Manual

Student Data Sheets (To accompany above manual)

Yellow Pages of Learning Resources

Values Clarification

Educator's Handbook for Secondary Career Guidance Programs

Career Education--What It Is and How To Do It

DAILY WORKSHOP SCHEDULE

Day 1 (Monday)

9:00 - 9:30 - Introduction of workshop leaders and participants and get-acquainted time.

9:30 - 12:00 - PLANNING A CAREER GUIDANCE PROGRAM

Goals:
1. To understand the importance of planning in Career Guidance program development.
2. To illustrate the importance of identifying and describing a task that is to be carried out by others.
3. To become aware of the trends in career guidance.
4. To provide participants with an overview of the purposes, processes and outcomes.

Participant Activities:
1. Do the Missing Square Puzzle. Two teams were formed. Team A was told to leave the room for 25 minutes while Team B received four envelopes which each contained four pieces of a puzzle. Team B members wrote a description of how Team A was to place the puzzle together. At the end of 25 minutes, Team A returned and following the direction, attempted to assemble the puzzle. The purpose of the activity was to illustrate the articulate cooperation needed among program planners (See Materials, H02)
2. Heard presentation, "What Is a Career Guidance Program?"

1:00 - 3:00 - ESTABLISHING GOALS FOR A COMPREHENSIVE CAREER GUIDANCE SYSTEM

Goals:
1. To make participants aware of the goals of a comprehensive career guidance system.
2. To identify individual priorities with regard to comprehensive career guidance goals.
3. To demonstrate an approach that can be used for arriving at group consensus on career guidance goals.

Activities:
1. Individuals took these 18 goals and placed them in priority order:
    1. Understand relationship of curriculum to career planning.
    2. Understand how economic conditions affect career plans
    3. Appreciate community role in career development
    4. Understand significance of social systems within work setting
    5. Acquire a sense of independence
    6. Develop decision-making skills
    7. Develop skills to cope with a changing work world
    8. Develop awareness of preferred lifestyles
    9. Acquire effective interpersonal skills
    10. Understand and appreciate the discipline of work

11. Develop career planning skills
12. Implement educational and job placement goals
13. Appreciate parental role in career development
14. Develop a positive self concept
15. Locate and use sources of occupational information
16. Develop positive attitudes toward work
17. Develop values clarification skills
18. Value human dignity (See Materials, HO 4)

2. Groups were formed and these small groups reached a consensus as to priority goals.
3. The small groups then came together into a large group and working with the small group consensus of priorities, decided on the three top priorities for the district.

Day 2 (Tuesday)

9:00 - 11:00 - NEEDS ASSESSMENT: HOW WELL ARE GOALS BEING MET?

Goals:
1. To show the relationship between program goals and assessing needs.
2. To acquaint the participants with one means of assessing needs.

Activities:
1. Individuals wrote a one-page report which identified the three areas (goal priorities) which need the most attention at their school.
2. In groups, a one-page report was written which identified the top three priorities and also provided rationale.
3. Marked rating chart as to how well their school met each of the 18 goals listed above.

11:00 - 12:00 - A NEEDS ASSESSMENT MODEL

Goals:
1. To help participants understand that needs assessment involves a variety of activities.
2. To give the participants a practical "how to do it" method for assessing present career guidance programs and their future direction.
3. To help the participants tailor a career guidance program to meet the needs of students.

Activities:
1. Heard a presentation, "A Needs Assessment Model."
2. Talked about what should go into a needs assessment instrument. Examples were given of needs assessment instruments (See Materials, HO 12).

1:00 - 3:00 - FIRST STEPS IN DESIGNING A CAREER GUIDANCE PROGRAM

Goals:
1. To help participants outline the program planning steps that are needed to implement procedures to reach program goals.
2. To help participants determine who will be responsible for each program planning step.
3. To help participants develop a schedule for completion of each program planning step.
4. To help particpants estimate the cost of each program planning step.

Activities:
1. Using the top 3 priorities as determined by the groups, and using Program Planning Sheets, participants began deciding:
   a. Steps to achieve goal
   b. Who is responsible
   c. Target Completion Date
   d. Cost
   e. Outcome

Day 3 (Wednesday)

9:00 - 10:00 - EVALUATING CAREER GUIDANCE PROGRAMS

Goals:
1. To help participants understand the career guidance program evaluation cycle.
2. To help participants understand that making judgments about career guidance programs requires the collection of data on all components of the career guidance program from a variety of individuals using a variety of data collection techniques.
3. To help participants plan how data is to be collected for the evaluation of a comprehensive career guidance program.

Activities:
1. Talked about methods of evaluating such as:
   - Interviews
   - Observations
   - Follow-up studies
   - Case studies
   - Trend analysis of class profile
   - Trend analysis of course selection and dropout rates
   - Standardized tests administered to students
2. Used the "Evaluation Matrix" and began to plan how the program would be evaluated. (See Materials, HO 15)

10:00 - 11:00 - IMPLEMENTATION APPROACHES FOR A CURRICULUM-BASED CAREER GUIDANCE PROGRAM - Basic Approaches

Goals:
1. To understand the importance of a team approach to a curriculum-based career guidance program.
2. To understand the characteristics of several curriculum-based career guidance implementation approaches.
3. To understand the elements (for example: physical facilities, available staff, etc.) that affect choice of approach to implemen-

tation curriculum-based career guidance programs.

Activities:

1. Listened to information presented as to the methods for implementing a curriculum-based guidance program.
2. Examined "Implementation Approaches" (See Materials, HO 16, 17, 18).

1:00 - 3:00 - APPLYING CURRICULUM BASED CAREER GUIDANCE APPROACHES TO A SCHOOL SETTING

Goals:

1. To learn how different curriculum-based career guidance approaches can be used in a specific school setting.
2. To be able to select and justify an appropriate curriculum-based career guidance approach for a specific school setting.

Activities:

1. Prepared and presented campaign speeches to support one of the implementation methods (See Materials, HO 19)
2. Voted as to which of these methods for implementation of a curriculum-based guidance program was best for Paige School:
   - separate class
   - infusion
   - career center
   - infusion and career center
   - separate class and career center
   - infusion and separate class
   - infusion, separate class, and career center

(OPTIONAL)

Day 4 (Thursday)

9:00 - 10:15 - ESTABLISHING OBJECTIVES FOR A COMPREHENSIVE JOB PLACEMENT PROGRAM

Goals:

1. To make participants aware of the objectives of a comprehensive job placement program.
2. To demonstrate an approach that can be used for identifying objectives and priorities for a school-based job placement program.

Activities:

1. Took these 18 job placement goals and organized them according to priorities:
   1. Assist in educational program evaluation
   2. Organize data bank for job placement applicants
   3. Determine type of job placement program needed
   4. Coordinate career planning and placement activities/services
   5. Assist students in career planning
   6. Persuade employers to hire school-age youth
   7. Evaluate and improve job placement program
   8. Obtain, post, and update job orders
   9. Establish job placement program policies and operating procedures

10. Provide consultant services for faculty
11. Teach job-seeking skills
12. Establish positive employer relationships
13. Implement accountability procedures
14. Screen and refer candidates for job interviews
15. Provide inservice training for job placement staff
16. Promote awareness of job placement program
17. Teach pre-employment skills
18. Persuade employers to tailor jobs to fit individuals

10:15 - 11:45 - A COMPREHENSIVE VIEW OF A JOB PLACEMENT PROGRAM

Goals:

1. To acquaint the participants with the scope and variety of services provided to students, teachers, counselors, supervisory staff, and employers by a school-based job placement program.
2. To acquaint the participants with the various organizational patterns that exist for the delivery of job placement services.
3. To acquaint the participants with some trends that are taking place with regard to job placement.
4. To help teams become aware of their orientation to job placement as reflected by their rating of the Job Placement Program Objectives.
5. To assess the extent to which the Placement Program Objectives are being met by present school efforts.

Activities:

1. Listened to presentation concerning job placement objectives.
2. Did the Job Placement Objectives Interpreted (See Materials, H021)
3. Rated job placement objectives.

1:00 - 3:00 - DETERMINING A JOB PLACEMENT PROGRAM PLAN OF ACTION

Goals:

1. To help participants establish job placement program priorities.
2. To help participants outline a plan of action for implementing job placement program priorities.
3. To help participants determine who will be responsible for each program planning step.
4. To cause participants to estimate the cost of activities included in their job placement action plan.

Activities:

1. In groups and using Planning Sheets, the top 3 placement priority goals were developed into procedures.

Day 4 & 5 (Thursday & Friday)

PLANNING AND DEVELOPING OF DISTRICT-WIDE PROGRAM

Goals:

1. To illustrate through a display, materials and resources that are available for career guidance programs.

2. Using local speakers, discover how the community views the school and what responsibilities are placed upon it.
3. To formulate a district-wide career guidance program plan.
4. Using a workshop evaluation instrument, determine the workshop strengths and weaknesses.

Activities:

1. Observed through display, materials and resources that are available for career guidance programs.
2. Discovered from a panel discussion how the community views the school and what responsibilities are placed upon it. Local people on panel included:
   --School Board Member
   --Manufacturing firm representative
   --Local business person
   --Local professional person
   --Local farmer or agriculture representative
   --Local Chamber of Commerce representative
   --Local clergyman

   The following questions were presented to the panel members before the panel and discussion centered around them:
   --Each panel participant will briefly describe various related jobs in that area.
   --What are the characteristics you see as important for workers in getting a job?
   --What are the characteristics you see as important for workers in keeping a job?
   --What kind of academic skills should be taught in schools that would benefit people going into jobs in your field?
   --What would you like to see schools stress as far as work training skills are concerned?
   --What is your philosophy of work? What is your philosophy of leisure time?
   --What is the occupational outlook for young people in your field of work in this area? In Illinois? In the U.S.?
   --What advice would you like to give schools as they go about planning a career guidance program?
   --In what ways can the community help the schools with career education programs?
   --What types of resources and services can the community offer the schools?

3. Formulated a district-wide career guidance program.
4. Evaluated the workshop's strengths and weaknesses. (See evaluation section)

Workshop Evaluation

(Used After Structured Activities)

We would like to determine if: (1) the workshop met your needs.
(2) the workshop design and activities were appropriate for achieving workshop objectives.

Directions: Please circle the number which best expresses your reaction to each of the items below. Space for your comments is provided on the bottom portion of the page.

1.	The objectives of the workshop were:	Clearly Evident	7	6	5	4	3	2	Vague 1
2.	The organization of the workshop was:	Excellent	7	6	5	4	3	2	Poor 1
3.	Workshop materials and activities were:	Interesting	7	6	5	4	3	2	Dull 1
4.	The scope of the coverage was:	Adequate	7	6	5	4	3	2	Inadequate 1
5.	My attendance at the workshop should prove:	Beneficial	7	6	5	4	3	2	Not Beneficial 1
6.	Overall, I thought this workshop was:	Excellent	7	6	5	4	3	2	Poor 1

The stronger workshop features were: _____

_____

_____

_____

The weaker workshop features were: _____

_____

_____

_____

Comments: _____

_____

_____

Workshop Evaluation

(Used After Unstructured Activities)

Keeping in mind the last two days only unless specified otherwise, complete the evaluation using the following scale:
(E) Excellent (G) Good (A) Average (F) Fair (P) Poor

E	G	A	F	P	
					1. How beneficial to your needs were the materials and resources that have been displayed? Comments:
					2. How would you rate the panel discussion in helping you understand what the community needs from the schools? Comments:
					3. How would you rate the district-wide plan which has been formulated these last two days? Comments:
					4. Rate the individual help you have received during this workshop? Comments:
					5. How well was the workshop organized? Comments:
					6. Was the amount of work appropriate for the length of time involved? Comments:
					7. How would you recommend the 5-day workshop to someone in another district? Comments:
					8. How would you recommend the first 3 days? Comments:
					9. How would you recommend the last 2 days? Comments:

List the strengths of the workshop.

1. _____

2. _____

3. _____

List the weaknesses of the workshop.

1. _____

2. _____

3. _____

Use the reverse side for any additional suggestions or comments. Thank you.

CAREER EDUCATION RESOURCE LABORATORY

Buzzard Education Building Eastern Illinois University

Charleston, Illinois 61920

(217) 581-5524

It has been five months since the beginning of the 1976-77 school year, and eight months since you participated in the K-12 Career Education Guidance Planning Workshop. As was mentioned during the workshop, we are interested in how well your district is meeting the career education/ guidance goals determined during the workshop. We are also interested in overall program acceptance, and changes you might have made. Thank you for your input.

Sincerely yours,

Carol Sanders

Carol Sanders

Diane Blair

Diane Blair

District _____
Position _____ K-6 teacher
_____ 7-9 teacher
_____ 10-12 teacher
_____ Other
_____ Counselor
_____ Administrator
_____ Vocational
_____ Director
_____ Other

FOLLOW UP

1. Is your district following the K-12 career education/guidance plans developed during the workshop?

Yes	No	
_____	_____	totally K-12 plan
_____	_____	mostly at K-6 level
_____	_____	mostly at 7-9 level
_____	_____	mostly at 10-12 level

2. Were the plans accepted by school personnel not attending the workshop?

Yes	No	Not presented
_____	_____	_____

3. Were role responsibilities accepted by school personnel not attending the workshop?

Yes	No	Not presented
_____	_____	_____

4. Is your district meeting target completion dates determined during the workshop?

Yes	No
_____	_____

5. Have you shared what you learned during the workshop with colleagues?

Yes	No
_____	_____

6. Were the plans developed during the workshop realistic?

Yes	No
_____	_____

If your answer is "no" to the above question, please indicate why and state alterations._____
_____
_____

7. Do you feel other districts would benefit in having a similar workshop?

Yes	No
_____	_____

8. What would you point out as being the most significant way the workshop influenced your teaching activities? _____

_____

_____

9. What changes, if any, in the workshop would you suggest? _____

_____

_____

10. Would you like to attend additional staff development activities?

Yes _____ No _____

Please indicate the area in which you would like assistance.

_____ a. actual participation in group guidance activities
_____ b. demonstration of group guidance activities
_____ c. participation in guided activities which will take you into the community to work with business and industrial resources.
_____ d. participation in guided activities which would give you the opportunity to work with an experienced placement director
_____ e. help in integrating career development concepts into: (check those that apply).

_____ science
_____ math
_____ language arts
_____ social studies
_____ physical education
_____ music
_____ home economics
_____ art
_____ business and Distributive Education
_____ trade and Industry
_____ health
_____ agriculture
_____ other _____

_____ f. other techniques or topics _____

Copy of Materials Developed

Materials labeled "For Field Testing Purposes Only" were materials developed by the PAGE 2 staff. We are unable to include copies of all materials used during the workshops as they will not be available for dissemination until after field testing has been completed and they have been submitted to the United States Office of Education for clearance. Materials should be available for distribution by March 1, 1977.

Other materials handed out to participants included:

--Related Occupations to Interest and Ability in Fourteen Subject Areas (Occupational Circles)

--"Parent Involvement"

--Field Trip Information

--Community Resource Information

--Components of Career Concepts

--Basic Career Development Concepts

--Materials Evaluation Form

--"Annotated Bibliography of CERL Materials"

HO 2

Team B Instructions

Your Task

Beginning now you have 25 minutes to write a set of instructions that Team A will use to assemble the Missing Square Puzzle. Team A must assemble the pieces in the same positions as they appear in the Puzzle Key. In the envelope containing the Missing Square Puzzle there are 4 smaller envelopes. Each of these envelopes contains 4 pieces of a 16-piece puzzle. When the 16 pieces are assembled properly, they will form a square, the center of which is missing. You must observe the rules that follow.

PUZZLE KEY

When assembled properly, the puzzle will look like this.

Rules

1. Distribute the 4 envelopes containing the puzzle pieces to 4 different members of Team B.

2. The 4 team members who hold the envelopes will open them, take out the 4 puzzle pieces, and keep the 4 pieces in front of themselves during the entire time Team B is working.

   a. Pieces cannot be traded.

   b. Team B at no time assembles the puzzle.

   c. The puzzle pieces and envelopes cannot be marked in any way.

   d. A puzzle piece can be touched *only* by the Team B member to whom it was originally given.

3. Using the paper provided, prepare a set of instructions which tell Team A members how to assemble properly the Missing Square Puzzle. Team B may not show the Puzzle Key to Team A members at any time. Team B may not draw the assembled puzzle or any part thereof for Team A.

4. At the end of the 25 minutes, Team A will assemble the puzzle even if the instructions have not been completed. *Time may not be extended.* You must use the 25 minutes efficiently.

5. When Team A begins assembling the puzzle, you may give no further instructions. You will observe Team A, but you may not give any verbal or non-verbal clues as to the proper assembly of the puzzle.

HO 4

Individual Goal Rating Sheet

Instructions: Look at your Planning Board. Record the number of points you gave to each of the Goal Statements in the blank space next to each of the Goal Statements on this page.

Goals	Column 1	Column 2
1. Understand relationship of curriculum to career planning	_____	_____
2. Understand how economic conditions affect career plans	_____	_____
3. Appreciate community role in career development	_____	_____
4. Understand significance of social systems within work settings	_____	_____
5. Acquire a sense of independence	_____	_____
6. Develop decision-making skills	_____	_____
7. Develop skills to cope with a changing work world	_____	_____
8. Develop awareness of preferred lifestyles	_____	_____
9. Acquire effective interpersonal skills	_____	_____
10. Understand and appreciate the discipline of work	_____	_____
11. Develop career planning skills	_____	_____
12. Implement educational and job placement goals	_____	_____
13. Appreciate parental role in career development	_____	_____
14. Develop a positive self concept	_____	_____
15. Locate and use sources of occupational information	_____	_____
16. Develop positive attitudes toward work	_____	_____
17. Develop values clarification skills	_____	_____
18. Value human dignity	_____	_____

Save this sheet. You will use it again.

HO 12

Guidance Services Survey

Student Questionnaire

The Page High School is in the process of reevaluating current career guidance services for students and making plans for improving these services. As part of the planning process, we are very interested in the ways we might serve you better. We would appreciate your cooperation in completing this questionnaire.

Thank you.

---

1. What grade are you in? (Circle appropriate number.) 7 8 9 10 11 12

2. Sex Male _____ Female _____

3. What academic program are you in?

   _____ College Preparatory _____ General Studies _____ Vocational

4. Parents' educational background (Check one of the following for *each* parent.)

Mother	Father	
_____	_____	*Not* a high school graduate
_____	_____	Graduated from high school
_____	_____	Business school or trade school
_____	_____	Some college
_____	_____	Graduated from college
_____	_____	Do not know how much education

5. What do you plan to do on a full-time basis during the first year after you finish high school?

   _____ Work

   _____ Get married

   _____ Enter military service

   _____ Work at home for parents

   _____ Attend college or university

   _____ Enroll in some type of educational training such as business, trade school, technical school, nurse training, etc.

   _____ Other (Please specify)

   _____

6. How do you think your parents feel about whether you attend college after high school?

_____ Insist or expect me to go
_____ Want me to go if I want to
_____ They do not care one way or the other
_____ Do not want me to go

7. What is the highest level of schooling you are now planning to complete?

_____ Graduate or professional school (medical, law, etc.)
_____ A technical, trade, business, or beautician school
_____ A four-year college or university
_____ High school, then to job of my choice
_____ Two years of college
_____ Junior high school

8. Do you or have you worked during the summer or after school hours?

_____ No
_____ Yes, during summer only
_____ Yes, after school only
_____ Yes, during summer and during school year
_____ Yes, weekends only
_____ Yes, after school and weekends

If yes, what type of work do you do?

_____

9. After you finish high school, do you

_____ Prefer to remain in the local area
_____ Want to move to another place in the state
_____ Want to leave the state
_____ Don't know

10. How much help have your parents given you in planning your future career?

_____ A great deal
_____ Very little
_____ Some
_____ None

11. Do you feel the need for more vocational information or counseling to help you make better vocational plans?

_____ Vocational information only
_____ Some other type of assistance
_____ Vocational information and counseling
_____ I do not need any assistance at present

12. How much help has your counselor given you in planning your future career?

_____ A great deal
_____ Very little
_____ Some
_____ None

13. Is there anyone in your school who is available to talk to you about occupations and to listen to your interests and help you evaluate your capabilities?

_____ Yes _____ No

If so, what area does he/she represent? (Examples: Math, Counseling, Science, Industrial Arts, etc.) _____

14. Is there a need for more specific programs in helping students to make career decisions in all academic areas?

_____ Yes _____ No

a. At what grade level? _____

b. In what specific areas? _____

c. Any specific programs? _____

15. Do you think an elective course designed to aid a student in post high school planning should be offered at the senior high school level?

_____ Yes _____ No _____ Don't know

If yes, what would like to have included in this course? Check as many as apply.

_____ Self knowledge _____ Knowledge of vocations

_____ Skill in decision making _____ Knowledge of educational opportunities

16. Please note your need at this time for help with educational and career planning.

_____ Need considerable help in figuring out what I am going to do.

_____ Have some things planned but I could use additional help.

_____ Plans are pretty clear and I do not need additional help at this time.

17. Do you feel your present school courses are adequate to meet your future educational and vocational needs?

_____ Yes _____ No _____ Uncertain

18. How often do you discuss your future career with your counselor?

_____ Very often _____ Seldom

_____ Some _____ Never

19. Which is the most pressing concern for you now?

_____ Using my spare time
_____ Taking care of my health
_____ Taking part in community affairs
_____ Marriage and family affairs
_____ Getting along with other people
_____ Getting a job

20. When would be the best time to present career development materials to high school students?

_____ Freshman year
_____ Sophomore year
_____ Junior year
_____ Senior year
_____ All four years

21. Has the exposure to career development materials motivated you to discuss your post-high school plans with friends, parents, teachers, counselors, etc.?

_____ Yes
_____ No
_____ Exposure not sufficient

22. Would you be interested in engaging in further exploration of careers?

_____ Yes
_____ No
_____ Undecided

23. When you visited a school counselor, was he

_____ Very helpful
_____ Helpful
_____ Not helpful

24. Have you made a plan for your life's work?

_____ I have a definite plan
_____ I have some ideas but no definite plan
_____ I have no ideas of what I want to do
_____ I have not yet given this serious thought

25. Do you feel you know your interests and abilities well enough to decide about your future career?

_____ Yes, very well
_____ Yes, to some extent
_____ No idea or confused
_____ Never thought about them

26. How often have you thought about your plans for after high school?

_____ Very much
_____ Somewhat
_____ Seldom
_____ Never

27. How often do you think about quitting school?

_____ Often _____ Sometimes _____ Never

28. How sure are you about your choice of a course of study?

_____ Very sure; it is exactly what I want.

_____ Doubtful; I am not too sure it is what I want.

_____ Somewhat sure; I think it is what I want.

_____ I realize now I am in the wrong course of study.

29. If you have visited one of the school counselors this year, please check one of the reasons for your visit.

_____ Schedule problems

_____ Other reasons

_____ Personal problems

_____ Never visited school counselor

_____ Both schedule and personal problems

30. Do you feel that more vocational information or counseling will enable you to make more adequate vocational plans?

_____ Vocational information only

_____ Some other type of assistance

_____ Vocational information and counseling

_____ I do not need any assistance at present

31. Please note your need at this time for help with educational and career planning.

_____ Need considerable help in figuring out what I am going to do

_____ Plans are pretty clear and I do not need additional help at this time

_____ Have some things planned but could use additional help

32. If you feel a need for counseling on some personal matter, to whom do you talk to about your need?

_____ Teacher

_____ All of the above

_____ Parents

_____ None of the above

_____ Counselor

_____ Other

_____ Friend

33. Do you feel your present school courses are adequate to meet your future educational and vocational goals?

_____ Yes _____ No _____ Uncertain

34. If you are not now in the high school curriculum of your choice, in which of the following would you prefer to be enrolled?

_____ College preparatory

_____ Business education

_____ General education

_____ Technical-vocational

_____ I am now in the curriculum of my choice.

Overall Program					

HO 16

Implementation Approach I: The Separate Class

Curricular Implications

1. Relationship of subject matter to career development less likely to occur.
2. Is an addition to the curriculum.
3. Separate subject gives prominence to career development.

Administration

1. Treated like every other course in the curriculum--language arts, social studies, mathematics, etc.
2. Administration is centralized and greater coordination of staff, facilities, and equipment can be maintained.
3. Requires adjustment of school schedule.

Personnel

1. Staff immersed deeply in career guidance and have greater expertise to bring to the task.
2. Staff assumes more administrative responsibilities than in other approaches.
3. Depends on talents of small number of staff.
4. May require the addition or reassignment of staff.

Facilities and Resources

1. Generally located in one or two specific rooms.
2. Fewer numbers of instructional resources can be used by greater numbers of students.
3. Lends itself to setting up a career center.

HO 17

Implementation Approach 2: Infusion

Curricular Implications

1. Career development concepts are "infused" with subject matter concepts in ongoing curriculum.
2. Requires planning to assure an articulated program of career development.
3. Career development concepts may take "back seat" to subject matter concepts.
4. Can make subject matter concepts more "exciting."

Administration

1. Coordination is complex because many staff members are involved.
2. Scheduling problems are minimal.
3. Quality and quantity of career development activities will vary because of the large number of staff involved.

Personnel

1. Requires a minimum of faculty adjustment.
2. Involves many staff members.
3. Commitment and support required from many staff members.

Facilities and Resources

1. Resources are diffused throughout the school building.
2. Lends itself to setting up a career center.

HO 18

Implementation Approach 3: The Career Center

Curricular Implications

1. May function in place of a classroom approach.
2. May function as a curriculum supplement to the "separate class" and "infusion" models.
3. Gives prominence to career development.

Administration

1. Administration is centralized and greater coordination of staff, facilities, and equipment can be maintained.
2. Not likely to involve major change in school schedule.

Personnel

1. Requires a coordinator who is a trained guidance and counseling professional.
2. May require support staff (paraprofessionals, clerical staff, etc.).

Facilities and Resources

1. Needs to be located so that it is easily accessible to students.
2. Requires an inviting, attractive place where materials and resources can be displayed and group guidance activities can be conducted.

HO 19

Page Middle School

Page Middle School is located in a midwestern town of 46,000 residents. It is one of three middle schools in the district and has an enrollment of 763 students. It serves students in grades 6-8 with departmentalized curricular offerings.

The 44 professional staff members include the following specialized staff:

1 full-time guidance counselor	1 half-time media specialist
1 half-time guidance counselor	1 quarter-time school psychologist
1 full-time librarian	1 principal

Last fall, Mr. Barry, chairman of the English department, reported to Mrs. Young, the principal, that he had just attended the International Reading Association Convention and that he had picked up some good ideas about starting a career education program. He expressed the opinion that the guidance counselors cannot be expected to carry the total responsibility for career guidance and that he thought there were many career guidance activities that English department members could perform.

Mr. Barry mentioned in the faculty lounge that he had talked with Mrs. Young about his idea of having the English department assist with some career guidance activities. Mr. Finch, the media specialist, happened to be in the lounge, and he remarked, "Well, you may be right on target because the new catalogues we are getting are filled with new career guidance materials." Mrs. Hartford, head of the social studies department, reacted by saying, "Well, you can just keep all those career guidance materials right there in your little corner of the library because the social studies teachers are going to have enough to do this year with implementing the new series we just adopted."

Mrs. Young, the principal, followed up on the conversation she had with Mr. Barry. In essence she found out that (1) the guidance counselors already felt overburdened, (2) the superintendent was favorable to a career guidance program if Mrs. Young could juggle internal staff and resources for the program, (3) the social studies teachers were only lukewarm to the idea, (4) the parents she had talked to were glad that something was going to be done to provide more career guidance for their children, and (5) the librarian and media specialist would cooperate but they felt the library was not the place to have career guidance activities.

Mrs. Young is very proud of her school and wants to do the right thing. For the past ten years students at Page Middle School have scored extremely high on the Iowa Test of Basic Skills. Mrs. Young does not want to do anything that might result in a lowering of these scores.

TITLE: THE EMERGENCE OF A SERVICE SOCIETY: DEMOGRAPHIC AND SOCIOLOGICAL ASPECTS OF THE SECTORAL TRANSFORMATION OF THE LABOR FORCE IN THE U.S.A.

PERSONAL AUTHOR: BROWNING, HARLEY L.; SINGLEMANN, JOACHIM

DESCRIPTOR: *EMPLOYMENT TRENDS; *EMPLOYMENT PATTERNS; FEMALES; WORKING WOMEN; NEGRO EMPLOYMENT; MEXICAN AMERICANS; *LABOR ECONOMICS; MANPOWER UTILIZATION; JOB SATISFACTION; WAGES; STATISTICAL ANALYSIS

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 299P.

ABSTRACT: THIS STUDY EXAMINES THE INTER-INDUSTRY SHIFTS OF THE U.S. LABOR FORCE DURING THE LAST CENTURY--THE MOVEMENT FROM AGRICULTURE TO SERVICES. A SIX-SECTOR SCHEME IS USED TO DIFFERENTIATE THE TERTIARY SECTOR: EXTRACTIVE, TRANSFORMATIVE, DISTRIBUTIVE SERVICES, PRODUCER SERVICES, SOCIAL SERVICES, AND PERSONAL SERVICES. THE MAIN DATA SOURCE IS THE BUREAU OF THE CENSUS ONE PERCENT PUBLIC USE SAMPLES FOR 1960 AND 1970. INDUSTRY STRUCTURE IS IDENTIFIED AND ITS TRANSFORMATION TRACED IN EXAMINING LONG-TERM TRENDS, WORK SCHEDULING AND STABILITY OF EMPLOYMENT, AGE STRUCTURE AND INDUSTRY CHANGE, AND THE INTERRELATION OF INDUSTRY AND OCCUPATION. THE QUESTION OF WHO IS EMPLOYED AND IN WHAT SECTORS AND INDUSTRIES ADDRESSES THE INDUSTRIAL POSITION OF FEMALES AND BLACKS AND MEXICAN AMERICANS. SOME IMPORTANT CONSEQUENCES OF THE SECTORAL TRANSFORMATION ARE PRESENTED IN THE DISCUSSION OF EARNINGS INEQUALITY AND THE RELATIVE MERITS OF THE SECTOR MODEL AND THE HUMAN CAPITAL MODEL IN EXPLAINING THE TRANSFORMATION. FINALLY, A NUMBER OF SOCIOLOGICAL IMPLICATIONS OF THE CHANGE ARE ADDRESSED: CONDITIONS OF WORK, WORK SATISFACTION, AND WORK ALIENATION AND ITS IMPACT ON THE CLASS STRUCTURE. (NJ)

15. Supplementary Notes

16. Abstracts

This study examines the sectoral transformation by industry designation mainly for the 1960-1970 period, utilizing the 1/100 Public Use Samples. A new six-sector industry classification scheme is used that provides a greater differentiation of the tertiary sector: 1) Extractive, 2) Transformative, 3) Distributive services, 4) Producer services, 5) Social services, and 6) Personal services. Attention is centered on three distinct but interrelated questions: 1) How can the industry structure be identified and its transformation traced? 2) Who is employed in what sectors and industries? and 3) What are some of the important consequences of the sectoral transformation? The first question is addressed in the chapters on the long-term trends (1870-1970) of the sectoral transformation (II), work scheduling and stability of employment (III), age structure and industry change (IV), and the interrelation of industry and occupation (V). The second question takes up the industry position of females, particularly sex-typing of work (VI), ---CONTINUED---

16. ABSTRACT, continued

and the position of the two largest minorities, Blacks and Mexican Americans, in the industry and occupational structures and how they compare with Anglos (VII). The third question is covered in the discussion of earnings inequality and the relative merits of the sector model and the human capital model in explaining 1959-1969 changes (VIII). The final chapter (IX) addresses a number of sociological implications of the movement to the service economy: conditions of work, work satisfaction, and work alienation and its impact on the class structure. Some of the policy implications of this research are set forth.

ACKNOWLEDGEMENTS

This study was carried out at the Population Research Center of The University of Texas at Austin and we are grateful to the staff in facilitating the execution of the report. The title page lists three persons who contributed very substantially to the content of this report: Diana DeAre was chiefly responsible for the content of Chapter 4 on age and Allan King and Nancy Folbre did the economic analysis as reported in Chapter 8. We thank them for their indispensable contributions. They are not, however, to be held responsible either for their chapters or the report as a whole; this responsibility solely is ours.

We would like to acknowledge the help of others in preparing this report: Fran Gillespie, Leslie Wilson, Marta Tienda, and Jim Gundlach. Katie Bond and Ken Ramsey handled the programming of the census tapes with great skill. We are also indebted to Harriett Clements, Sandra Ellis and Beverly Moore who typed the various versions of the manuscript.

Of course, our prime acknowledgement is to the Manpower Administration, U.S. Department of Labor, who provided the funding for this research. Howard Rosen and Joseph Epstein helped our proposal through the review process. Larry Asch and Frank Mott were especially helpful and supportive in reacting sympathetically to our ideas. Betty Christgau has been remarkably patient in seeing the report through to its final form.

SUMMARY OF REPORT

Chapter I: INTRODUCTION

Two great trends characterize the sectoral transformation (inter-industry shifts) of the U.S. labor force during the last century: the movement out of agriculture and the growth of services. While this report covers all inter-industry shifts, particular attention is given to the expansion of services, both because of the relative recency of this change and because the causes and consequences of the move have been relatively neglected and therefore are not well understood.

Generally, the sectoral transformation has been analyzed by using the famous Fisher-Clark tri-partite division: primary (agriculture, mining, fishing, and forestry); secondary (manufacturing, construction and utilities); and tertiary (transportation, communication, commerce and services). Clark saw economic development as involving the movement out of the primary sector into the secondary sector and then from the secondary to the tertiary sector. Essentially, the forces behind these shifts were productivity gains (movement from lower to higher productivity industries) and the rising per capita income that stimulated the demand for a variety of services.

Although the three-sector scheme continues to be used, its value has progressively become weakened because the tertiary sector, which includes services, has increased much in relative importance but has become at the same time, because of the heterogeneity of services, more and more a residual category. It is difficult to speak meaningfully of the tertiary, when it includes banking and barbering, domestic and medical service, accounting and postal services. To attack this problem, a new sectoral allocation scheme is presented in this report, one that breaks down the tertiary into more meaningful sectors. The six-sector scheme is as follows:

1. Extractive (identical with primary sector)

2. Transformative (identical with secondary sector)

3. Distributive Services (transportation, communication, wholesale and retail trade, excepting eating and drinking)

4. Producer Services (financial, insurance, engineering, law and business services)

5. Social Services (health, education, welfare and government)

6. Personal Services (domestic, lodging, repair and entertainment)

Distributive and Producer services are "goods-oriented" services, because they cater to goods or matters related to property. They are also intermediate between the first two "production" sectors and the last two "consumption" sectors. Social services are new to the extent that their mass consumption historically is relatively recent, and the funds for their operation are dependent to a considerable degree on government revenues. Personal services are more heterogeneous, but they have in common an orientation to the individual consumer and the size of establishment is relatively small.

The Browning-Singelmann classification scheme was developed heuristically, based on a dissatisfaction with the Fisher-Clark scheme. It therefore does not purport to be a theory of development nor even of sectoral transformation. There is a similarity of approach with two other sector allocation schemes (Katouzian and Singer) derived independently, suggesting a move in the same direction. In any event, recognizing that even the six-sector scheme has considerable within-sector variability, most of the tables in the report provide figures on 37 industries within the six sectors. The main source of data is the U.S. Bureau of the Census 1% Public Use Samples for the census years of 1960 and 1970. Taken at the national level, they provide the most flexible means of analysis.

Chapter II: THE HISTORICAL CONTEXT OF THE SECTORAL TRANSFORMATION, 1870-1970

Most of the report is devoted to the 1960-1970 decade, based upon the 1/100 sample of the 1960 and 1970 censuses. This decade should not be seen in isolation, however, but in the historical context of a century of change, even if the coverage cannot do justice to the complexity of earlier periods.

In 1870, 52.3% of the U.S. labor force was in the Extractive sector. Fifty years later in 1920 it had declined to 28.9% and by 1970 it had further declined to a mere 4.5%. The Transformative (secondary) sector for the same periods rose from nearly a quarter (23.5%) of the labor force to nearly a third (32.9), but then changed relatively little over the next fifty years, ending at 33.1% in 1970. Of course, output in agriculture and manufacturing, especially in the last fifty years, have had astounding gains, due to greatly increased productivity. Clearly, the number or proportion of persons employed in a sector does not necessarily reflect the magnitude of its output.

Turning to services, the importance of distinguishing among the sectors and even the industries becomes necessary, for although services as a whole increased for every decade, the gains were very uneven, and in one important industry exception, there was a large decline. Domestic service was 7.4% of the total labor force in 1870 (nearly a third of all services), but by 1970 it had dropped to 1.7%. Distributive services had its greatest relative gain during the period 1870-1920, with transportation experiencing a strong expansion. Since 1930, however, the system of transport has been able to move goods and people with proportionally fewer workers. Trade, on the other hand, has increased slowly but steadily through the century, doubling its' share of the labor force. Producer services were so small they were included with trade until 1910, but in the last half century they have had an impressive surge, going from 2.8% to 8.2% of the total labor force. While some industries in Personal services grew, the impact of the decline in domestic service has meant almost no change for the century (9.3% in 1870 to 10.0% in 1970).

The really impressive change among services occurred in Social services, for the sector increased in every decade from just 3.4% in 1870 to 21.9% in 1970, the gain being greatest during the last two decades. Within the sector, education jumped from 3.8% to 8.6% between 1950 and 1970, whereas government--often maligned for "bloated" growth--increased from 3.7% to 4.6%.

All the above-noted changes occurred in a country that witnessed many other basic structural transformations. The percent urban increased from about one-quarter to three-quarters of the population, the white-collar component of the occupational distribution grew from 18% in 1900 to 49% in 1970, and the female participation rate more than doubled during the latter period, from 20.4 to 43.4. These changes were closely related to the sectoral transformation. Although this sectoral transformation has had its greatest shift since 1940, the trend had begun much earlier in American history.

Chapter III: LABOR INPUT AND WORK CONTINUITY

The trend to the service sectors has been very pronounced in terms of employment but it is not necessarily true that there have been comparable changes in terms of labor input. That is, the distribution of workers among industries will not necessarily coincide with the distribution of labor as measured by the yearly hours worked. Attention has been called to the fact that services are characterized by a high proportion of part-time employment, so it may be that the shift to the services is a good deal less impressive if one uses input rather than employment as the standard.

Taking the 40-hour week as the standard for employment, Transformative and Social Services have the highest figures (each approximately one-half) with male and female showing little difference. Extractive and Personal services have the lowest proportions (about one-quarter), with Distributive and Producer services intermediate. With weeks worked, the sex difference widens considerably, with three-quarters of males working 50-52 weeks in 1969 compared to 54% for females. It is possible to combine hours per week and weeks per year into an overall index of yearly hours per worker. For the total male labor force it was 2002 hours, while the female labor force was three-fourths this total, at 1521 hours, and were lower in all six sectors.

In comparing the distributions by employment and hours, it is true that service sectors as a whole have less hourly than employment representation, but this difference is in large part due to the female distribution. Three industries account for the female pattern: retail, education, and domestic service; together they account for -4.5% in hours as compared to employment.

It is known that service sectors in total have expanded but it is not known how this shift has occurred. Was the expansion brought about mostly by people moving from Extractive and Transformative sectors into services, or did services grow largely because of new labor force entries? This question can only be answered wholly satisfactorily by detailed work histories, but this is not possible with census data. However, the 1970 census had a question that asked the industry a person was employed in 1965. Since the question was asked of all persons, it includes people who were not in the labor force in 1970, but did work in 1965, as well as those who were not in the labor force in 1965 but who were employed in 1970.

Generally, the data do not indicate that the sectoral transformation of the labor force has been the result of persons having left other industry sectors for employment in Social and Producer services. It can be concluded, therefore, that the growth is mainly due to persons not previously in the labor force who enter these particular services in disproportionately large numbers.

Chapter IV: AGE AND SECTORAL TRANSFORMATION

Age is a variable worthy of consideration in its own right, rather than simply as a control variable, as is so often done. In terms of the age distribution, the Distributive, Personal and Producer services are more likely to be entry sectors, while the Extractive sector has its strongest representation in the older age categories. The age-sex pyramids for sectors and industries reveal the considerable variation that exists. Only a few pyramids display similar configurations for the male and female sides; the sexual division of labor is strikingly apparent at a glance.

While a comparison of age-sex distributions for the 1960-1970 period is valuable, what is needed is a standard by which to evaluate the change during the decade. The familiar practice of formulating an expected change and then comparing it with the actual change is our point of departure (in this instance the "shift" technique is used). For five age categories the growth rate for the decade of the total employed population is taken as the standard or expected change. It can then be compared to the change for specific sectors and industries. The difference between the two sets of figures indicates the extent to which age categories for each sector and industry grew more or less rapidly than expected. The shift analysis separates the actual change into two components: the expected change and the net shift. The expected change (the growth rate of all persons in the age category) reflects such factors as changes in age and sex specific participation rates, changes in age of entry and of retirement, etc. The assumption is that all such factors affect the groups equally within each sector and each industry. The net shift component is assumed to pick up changes caused by intersectoral movements of members continuing in the labor force, as well as the differential patterns of the incorporation of entry cohorts into specific industries and sectors.

It is difficult to summarize the diversity of findings that the variable of age assumes, but it is very clear that there is nothing mechanical or indeed obvious about the ways through which age operates in the transformative process. One of the features of the net shift results is the pattern of sign consistency. With only a few exceptions, the signs for the five age groups within sectors and industries go in the same direction; they are either positive or negative. This pattern could have been anticipated for industries that grew much less than expected (e.g., agriculture) or much more (e.g., education) but its presence in other industries is rather a surprise. An additional generalizable feature is the relatively narrow range that the net shift displays as a percentage of the 1960 size. If one age group is growing much more rapidly than expected then the others will also, and vice versa. The proportion of the total positive and net shift accounted for by Social services is remarkable: 76.8% for total, 58.5% for male and 81.9% for female. The last figure is especially impressive, for the net shift technique controls for the increase in labor force participation of women during the 1960-1970 decade.

Chapter V: THE INTERRELATIONSHIP OF INDUSTRY AND OCCUPATION

Industry and occupation are interrelated. Specific enterprises are created within specific industries and then individuals are recruited to occupy specific occupational positions. A theory of work allocation has not been formulated that encompasses simultaneously these two dimensions; both economists and sociologists concentrate on occupational position.

In linking changes in occupational structure to changes in industry structure, particularly the sectoral transformation of the labor force, it is established that during the 1960-1970 decade four occupational categories expanded their shares of total employment: professionals, semi-professional, clerical workers, and service workers. Most impressive was the growth of professionals and clerical workers. The growth of these occupations during the 1960's resulted in two changes: 1) clerical workers replaced operatives as the largest single occupational category; and 2) white-collar workers now outnumber blue-collar workers. Such changes in the occupational structure merit analysis in their own right. For example, the growth of professionals can be seen as the diffusion of expertise and the growth of clerical workers as an indicator of the bureaucratization of the work force.

In this chapter, however, the focus is on the attempt to identify the sources of occupational changes by demonstrating how industries differ in their occupational distribution of employment. Farmers are found only in agriculture, but most other occupational categories are spread throughout the various industries. As the industry structure of the labor force changes one should also expect changes in the occupational structure. It is thus possible to identify two sources of changes in the occupational structure: 1) changes in the occupational distribution of employment within industries irrespective of changes in the industry structure; and 2) changes in the industry itself, as in the sectoral transformation of the labor force.

The findings show that two-thirds of the changes in the occupational structure between 1960 and 1970 resulted from the component of sectoral transformation. In particular, the case of professionals is interesting. Had total employment not shifted from industries with a low professional demand to industries with a high demand for professionals, there would have been proportionately fewer professionals in the labor force in 1970 than in 1960. In other words, the within-industry specific demand for professionals decreased during that period. Of course, this situation did not exist in all industries, but was found primarily in those Social services, such as medical services, that traditionally have employed a large proportion of professionals. This trend suggests that such industries have become more bureaucratized and their work more standardized. To continue with the example of medical services, more and more work is delegated from professional to service positions. In this instance the increase in service workers largely was due to changes in the occupational distribution within industries.

The identification of the sectoral transformation as a source for occupational changes has some important consequences for social mobility. As a result of the shift from goods-producing industries to services the proportion of higher-status occupations increased, thereby creating a favorable environment for upward mobility. As the pace of the sectoral transformation slows, this source of demand for higher-status occupations will decline. Unless this trend is offset by factors that foster

the "upgrading" of the occupational distribution within industries, the result will be a greater competition for higher status positions and lower upward social mobility.

Chapter VI: FEMALES IN THE LABOR FORCE

One of the more striking features of the sectoral transformation is the growing importance of females in the service sectors. In 1970 over 78 percent of all women were employed in services, as compared to 47 percent of all males. But not all services are equally female-oriented. Women are most concentrated in Personal services (save for repair services) and Social services, whereas they account for a relatively small share of employment in transportation and wholesale trade. Related to the concentration of women in service industries is their occupational distribution: in 1970 two-thirds of all employed women had professional, clerical, or service occupations. By contrast, males were relatively more concentrated in the blue-collar occupations of operatives and craftsmen, together accounting for two-fifths of total male employment in 1970.

In both 1960 and 1970 females were more likely to have a professional occupation than were males. This finding must be taken with caution, however, since women professionals in general occupy predominantly the lower-status positions of primary and secondary teachers and nurses. Nearly nine of every ten female professionals in 1970 were employed in education, medical services and hospitals.

While the sex-typing of occupations is well known, the sex-typing of industries is also apparent. Industry sex-typing occurs when one industry is dominated by either sex, independent of its occupational distribution. To analyze the amount of industry sex-typing it is assumed that the percent female in each occupational category is constant among industries. Thus, if a certain industry has a high demand for craftsmen, it can be expected that females are less represented in this industry than in the total labor force, for there are very few craftswomen. By comparing the number of females in a given industry that could be expected on the basis of the industry-specific occupational distribution with the actual number of females in that industry, the degree of industry sex-typing can be determined. If an absolute difference of 10 percentage points between the actual and the expected number is set as the criterion for sex-typing, the following industries were found to be female dominated in 1970 (in decreasing order): domestic service, textiles, laundry, hospitals, medical services and education. The following industries were male dominated in 1970: postal services, engineering, transportation, mining, utilities, wholesale trade, real estate, chemical, accounting and government. It should be noted that the listing of industries that were sex-typed in 1970 is very similar to those that were sex-typed in 1960.

In the past, the physical requirements of work has often been cited as contributing to the division of labor by sex. In a service-dominated labor force, however, work has lost most of its demands for heavy muscular effort, thus providing at least the opportunity for men and women to work in comparable positions.

Chapter VII: THE SECTOR AND INDUSTRY POSITION OF MINORITIES

In the first part of this chapter blacks and whites on the national level are compared. In the second part the analysis is extended to include Mexican Americans, but due to data limitations (the Bureau of the Census identifies Mexican Americans only for the five Southwestern states), this analysis can be carried out only at the regional level.

During the 1960's the industry structure of black employment changed more than did that of whites. Black males primarily left agriculture and Personal services. One of the most striking changes was the pronounced decreasing share of black female employment to be found in Personal services. In 1960 this one sector accounted for over one-half of all employed black females, but in 1970 the corresponding figure was only 29 percent. As a result of these changes, black and white workers of both sexes were more equally distributed than was true ten years earlier.

Despite the increasing similarity between blacks and whites with regard to industry structure, a substantial gap still remains in terms of occupational status and income. Two-thirds of black males in 1970 were employed as operatives, service workers, laborers, or farm workers, which is twice the share for white males. Black females also showed a higher concentration in these occupations than did white females, but the difference between black and white females was not as large as that between black and white males. In general black females compare more favorably with white females than do black males with white males, be it in terms of educational attainment, occupational status, or income. The data for income were particularly noteworthy, for in 1970 the median income of black females was higher than that of white females in 14 industries. All of these industries except one were services of one kind or another, with most of the ten belonging to the Social services sector. It should be noted, however, that black women on the average also worked more hours per year than did white women, particularly in Social and Personal services, which would increase their earnings relative to white women.

There are additional reasons why black females have a better relative position than black males. For one thing, females in general are in less favored positions than males. Thus, once the sex differential in terms of the labor situation is controlled for, not much additional discrimination exists. Moreover, black females have a higher labor force participation rate than white females. Since continuity of employment is positively associated with income, black females should be expected to do as well as, if not better than, white females.

In the second part of Chapter VII Mexican Americans are included in the analysis. Besides the interest in examining the labor force situation of the second largest minority group in the country (compared with blacks not much information exists about Mexican Americans), the inclusion of Mexican Americans permits the comparison of the work situation of the two minorities with each other. The findings show that although Mexican Americans had a lower educational attainment than blacks, they occupied higher-status positions. This finding casts serious doubt on the assumption traditionally held that the lower occupational status of blacks in comparison to whites is, by and large, a consequence of their lower educational attainment. Although the effects of education on occupational status cannot be

ignored, two different levels of analysis must be distinguished. While higher educational attainment benefits individual members of minority groups, a general increase in educational attainment among all blacks might not improve materially their aggregate labor force situation in relation to whites. The data thus suggest that the lower occupational status of blacks, while partly the result of their lower educational attainment, also results from discriminatory employment practices. The reason why this does not apply to Mexican Americans to the same extent is the fact that as a minority group they are less readily identified than blacks (the Bureau of the Census, while recently providing much more information on the Spanish origin population, still classifies Mexican Americans as white). As a group, Mexican Americans are less subject to discrimination than are blacks.

Chapter VIII: EARNINGS DISPERSION AND THE SECTORAL PATTERN OF EMPLOYMENT

In a very fundamental sense, earnings (and since we are dealing with the labor force it is earnings rather than income that concerns us) represent an extremely significant "outcome" of the various factors, as reviewed in prior chapters, that affect the sectoral and industry distribution. Given the macro orientation of this study, however, the concern is not with linking the earnings of individuals with other personal characteristics, but with the distribution or dispersion of earnings by sector and industry. Within this context, the sectoral approach to earnings distribution can be contrasted with the human capital approach. In essence, the former assumes that the distribution of earnings within each sector is regarded as an intrinsic, unchanging characteristic, with the pattern of final demand for goods and services determining the sectoral pattern of employment. In contrast, the latter is a supply-side theory of the earnings distribution, which is a reflection of the skill-mix of the labor force and the rates at which these skills are rewarded. Thus changes in the distribution of earnings are regarded principally as changes in the distribution of labor force skills. An evaluation of these two approaches is made empirically by comparing how well they predict the changes in the dispersion of earnings in the U.S.A. between 1959 and 1969. In addition, the sectoral and human capital approaches can be combined into a single model.

The data apply only to white and black males since the census data are poorly suited for an analysis of the earnings distribution among women in the human capital framework. Principally this is because of difficulties in measuring labor force experience for females because of their often intermittent pattern of labor force participation. The measure used to summarize the earnings distribution is the variance of the natural logarithm of earnings, chosen over other measures principally because it is a relative measure of dispersion. Proportional changes in earnings will have no effect on this statistic.

In predicting changes in the earnings dispersion in the U.S. between 1959 and 1969, it was found that the simple assumption that the variance in earnings within each sector was constant between 1959 and 1969 and the mean levels of earnings increased proportionally (the sector model) resulted in a rather good prediction. In contrast, the human capital model, which assumes that rewards to education and experience of the labor force remain fixed in relative terms over the decade leads

to poor predictions of the change in the earnings distributions of both white and nonwhite males. The combined model was outperformed by the sectoral model by a large margin. Further research is needed on how the parameters of the human capital model are likely to change over time, but it is fair to say that there is no macro theory of human capital and little is known about the determinants of the model's parameters.

Chapter IX: THE SECTORAL TRANSFORMATION AND THE NATURE OF WORK IN A SERVICE SOCIETY

Given the key role of the Extractive sector during the 1870-1970 period, it is unlikely that there will be comparable future shifts in the sectors, simply because no one sector can provide the source of change as did the Extractive Sector, when it dropped from 52% to 4% of the labor force. The social and economic consequences of the sectoral transformation are not easy to identify, partly because so much of the change has occurred within the last decades. But if it is probable that the greatest part of the sectoral transformation of the U.S.A. already is behind it, this does not mean, therefore, that we have experienced all the social and economic consequences of the transformation. Institutional adaptation is likely to develop more slowly than the labor force change. For example, the fact that with a few prominent exceptions, e.g. transportation, services are much less unionized than industries of the Transformative sector does not mean necessarily that this is an unchanging relationship. In future decades it is entirely possible that the difference will narrow considerably.

Sociologically, the sectoral transformation can be examined in terms of its effects on work. In general, the shift out of the Extractive sector and into the service sectors has meant a reduced reliance on physical strength to perform tasks. Compared to the Transformative sector, services do not command the advantages of scale, of continuous, routinized output, and they generally cannot be stored. This means that many services can have a greater flexibility in work scheduling than is the case in other industries. This may or may not result in greater work satisfaction, and the reason why this is so is by no means clear. Certainly, it warrants more attention than has been devoted to the problem. The notion of alienation, whether conceptualized in social psychological terms or along more structural and Marxian lines, is germane. The fact that most services do not produce a tangible product conceivably may create even more alienating conditions, for labor and product become one, as in the case of the salesperson.

The relationship of sectoral transformation to social stratification and to social classes and their dynamics still is obscure. The largest sector in services is Social services and here employment is largely concentrated in the public sector. The implications of this for, say, political action are problematical. Interest groups may be expected to emerge out of the configurations of occupation and industry, jointly considered. Because of the lack of agreement about the consequences of the sectoral transformation, or even as to what are the proper questions to be put to this problem, the authors of this report, as did Victor Fuchs in his earlier influential book, The Service Economy, are driven to conclude that much more research is needed on services and, indeed, on all industry sectors as they become transformed.

Chapter I

INTRODUCTION

It is inevitable that in the course of a country's growth and development the labor force must be transformed. There are many facets of this transformation. Moore (1966) has identified the following: 1) the "creation" of the labor force in the technical sense of the separation of work from other activities (still an important consideration for the activities of women); 2) the "upgrading" of the labor force as a consequence of higher skill demands and increased educational attainment, including intra- and intergenerational mobility; 3) the increasingly complex division of labor that calls forth much greater occupational specialization; and 4) the sectoral relocation of manpower from the standpoint of industry allocation. In this study our point of departure will be the sectoral allocation of the labor force and its transformation, but some attention will be given the other features.

First of all, however, an important distinction must be made. Because occupation and industry as labor force categories continue to be persistently confused in the literature, the difference between them should be made explicit. Most simply put, occupation is the kind of work one performs while industry is the kind of place where one works. To illustrate, one's occupation may be as a secretary, but the place of work may range from a gigantic steel mill to a small office of an insurance agent. The growing specialization in our society has made it impossible to deal directly with specific jobs or specific places of work, even though the U.S. Bureau of the Census identifies thousands of occupations and hundreds of industries. In this study relatively gross industry and occupational categories will be used, but we believe this practice will not seriously affect our findings.

Anyone who attempts to make sense of the sectoral transformation of the labor force in both developed and developing countries must be impressed by the two great master trends of the 20th century. The first and best known is the shift of manpower out of the "primary" sector (chiefly agriculture, but including mining, forestry, hunting and fishing). For many developed countries this movement has been going on virtually uninterrupted during the last 70 years or more. Indeed, it has gone much farther than most would have believed possible. In the United Kingdom and the U.S.A., for example, employment in agriculture has dropped below 5 percent of the total labor force, and the decline still continues. In nearly all developing countries a relative decline of employment in agriculture has been observable in the last 30 years, but only in a few countries has an absolute decline in agricultural employment been observed. The movement out of agriculture is assumed to be an integral part of the development process and generally it is agreed that the remarkable increases in productivity in the agrarian sector, when combined with a relatively low elasticity of demand for agricultural as compared to manufactured products, have permitted the decline in agricultural employment.

The second master trend is the shift into the tertiary or service sector. This has been a more recent phenomenon and has not had the impact, at least until now, of the shift out of the primary sector, but the trend is a strong one and appears to be irreversible and of truly universal dimensions. In a recent study of labor force changes in ten industrialized countries (Sorrentino, 1971), all have experienced increases in service employment since 1950, and in six countries the

service sector now accounts for over 50 percent of total employment. In the U.S.A., service industries accounted for 62 percent of the labor force in 1970, and by about 1980 we can expect two of every three persons to be employed in a service industry of one kind or another. In developing countries the trend to the service sector also is unmistakable, although it has not attained the same levels as in the developed countries.

The purpose of this study is to examine the sectoral transformation of the labor force of the U.S.A., with special attention given to the shift to service employment. Although a brief survey of the long-term trends from 1870 to 1970 is provided, the bulk of the analysis is devoted to the 1960-1970 period, drawing extensively upon the 1% Public Use Samples available from the 1960 and 1970 censuses.

Before we set forth the content of this monograph, however, it is necessary to place the matter of sectoral transformation in somewhat broader perspective, especially the growth of the services, and to justify why we believe this process to be an important aspect of socioeconomic change. Unlike the movement out of agriculture, there is no general consensus on the causes and consequences of this phenomenon, nor, for that matter, a clear understanding of how this process occurs. In part, this can be attributed to the relative recency of the growth of services. But this is inadequate to account for the relative neglect of industry structure and process as it is linked to economic growth.

Let us consider the situations in economics and sociology as a way of accounting for this neglect. Economics is probably the one discipline where we should expect to find most attention given to industry sectors and their transformation because of their close relationship to economic development. The record, however, is at best spotty. Among notable economists, perhaps it is Simon Kuznets in recent years who has stressed, within an international context, the importance of industry as an analytical variable. As he states in his Modern Economic Growth (1966:153):

> The industrial structure of national output and productive resources is a key aspect of an economy in the process of growth because it permits us to observe the impact of the advance in technological knowledge, the differential response of demand to increased productive capacity and rise in per capita income, and the shifts in the size and location of groups in society associated with different industries. Industries are distinguished from each other by the raw materials they use, by the productive process in which they engage (and hence by the technological constraint on size of plant), by the skill mix of the labor force, by the capital intensity, etc., imposed by the specific production processes employed, and by the finished product, and hence by the market that is being served. Indeed, an industry is defined by these characteristics of material, process, and product; and a marked change in one, often but not necessarily accompanied by changes in the others, is usually a basis for distinguishing and defining a new industry.

But Kuznets was interested in the broad characteristics of the sectoral transformation and he did not pay particular attention to the service sector. It was

Victor Fuchs, first in a number of articles and then in his monograph The Service Economy (1968) who provides what still remains as the best single discussion of the nature of services in the U.S.A. In his opening paragraph (1968:1) he put it as follows:

> The United States is now pioneering in a new stage of economic development. During the period following World War II this country became the world's first "service economy" -- that is, the first nation in which more than half of the employed population is not involved in the production of food, clothing, houses, automobiles, or other tangible goods.

In spite of the fact that services steadily has been becoming more important in the U.S.A., this sector still has not received from American economists much attention, especially in comparison to that lavished on agricultural and manufacturing changes. Fuchs (1968:16) explains this neglect as due to a number of factors:

> ...The greater attention that has been given by economists to the primary and secondary industries might be explained by many factors: (1) Tertiary employment becomes of major importance only when high levels of income per capita are reached. (2) Some early economists, notably Adam Smith, believed that only the primary and secondary sectors were "productive," and that the other industries were in some sense "parasitic." (3) It is usually much more difficult to obtain data for the service industries, many of which are characterized by small-scale operations. This is also true of agriculture but, in that case, at least the output tends to be standardized and thus more easily measured. (4) Much tertiary production is non-profit; economic analysis has concentrated on market activities.

If the above reasons suggest why the services have not received their due from the economists, the general neglect by sociologists of the dimension of industry position and of services must be sought on other grounds. In brief, the reasons appear to be that sociologists have been mesmerized by occupation, as witness the huge literature on social stratification and social mobility. The few studies of industry position (e.g., Duncan, 1959) have attracted little attention. It is true that Daniel Bell, in his The Coming of the Post-Industrial Society (1973), makes the movement into services one of his key indicators ("A post-industrial society is based on services."), but he largely ignores it as an analytical variable in his subsequent discussion.

We conclude that in both economics and sociology the relative lack of interest in industry sectoral transformation, while due to a variety of factors, has in common the absence of a clearly and compellingly formulated statement of the theoretical importance of this process. In the currently fashionable terminology of Kuhn, there is no "paradigm" for the sectoral transformation that serves to attract attention and to encourage and legitimize research on the subject.

But what is there that is significant about the sectoral transformation and especially the movement into services that merits our attention? Can it be said that we now are in or on the verge of being in a Service Revolution that

compares in importance to the Agricultural Revolution and the Industrial Revolution? Probably not. The latter two transformations brought about extensive and innovative changes in settlement patterns, in the spatial links between home and work, in the productivity of labor, in the emergence of identifiable social classes, and in the configuration of power relations related to access to technology and the accumulation of capital. As yet, we are unable to point to any distinctive way in which services have brought about changes in the dimensions mentioned above. Services, like manufacturing, are concentrated mainly but not exclusively in urban areas; most service employment involves the separation of home and workplace; services have not introduced any quantum leaps forward in the productivity of labor; services have not brought into being clearly identifiable social classes that are different from those of earlier societies (e.g., lords and peasants in the Agricultural Revolution and capitalists and proletariat in the Industrial Revolution); and services are not clearly identified with any new or old bases of technology or power.

But the emergence of services as the dominant form of employment does alter society in some important yet not well understood ways. Many of the current trends are contradictory, which makes it even more difficult to identify and to interpret concrete changes. For one thing, the majority of services are becoming increasingly capitalistic, i.e., capital spreads to more and more service industries and the work in services becomes increasingly that of wage labor. However, Social services are among the most rapidly growing of all service industries, and most of it belongs to the public sector. There is a theoretical difference between wage labor in a privately owned, profit-oriented industry and that in a government industry which is nonprofit.

A second major change takes place in the relationship between the worker and his or her labor. As we noted above, most services do not produce a tangible good. Associated with this situation is the continuous decrease of blue-collar work requiring much physical exertion. As we shall elaborate later on, the scheduling of work in many services is quite different from that in most manufacturing. Theoretically, at least, the nature of work in services can be tailored much more to the preferences and needs of the employees and workers than would be possible in goods-producing industries. It must be pointed out, however, that a substantial part of work in services is repetitive and of low status, and is far from being the creative work that some have envisioned as a characteristic of employment in a service-dominated future.

There are other, less concrete, changes associated with the growth of service employment. The close linkage between the production of a service and its consumption and the related contact between the producer and the consumer provides for a different work situation as compared to more isolated production settings. Many employees have to relate to their employers <u>and</u> to their customers. Indeed, many services (whether buying a dress, consulting a physician, or filling out a government form) require close cooperation between those who provide the service and those who consume it. This three-way relationship (employer-employee-customer) has the potential for various conflicts of interest.

Other problems arise when we examine the transformative process and the growth of services at the national level, particularly the relationship of the "tertiarization" process to economic development. Here we find that tertiarization

is appraised rather differently in developing countries and developed countries. Generally, in the latter the trend toward concentration of employment in tertiary activities has been viewed positively, as a concomitant of economic growth. Fuchs (1968) makes it quite clear that "The dramatic shift to services has occurred in employment--not in output." In other words, this is no zero-sum game, in which an increase in service or tertiary employment necessarily would bring about a reduction in output in the primary and secondary sectors. The technological advances in these sectors means that production increases more rapidly than employment. Rising per capita income creates a demand for a host of services and the economy can absorb an increasing share of the labor force in service employment. It should be noted, however, that with nearly two-thirds of the labor now in service employment, there now is some apprehension that productivity increases are more difficult to bring about, because of the concentration in this sector.

In contrast, the growth of the tertiary sector in developing countries has been evaluated negatively; indeed, "tertiarization" as it is sometimes called, is considered a sign of mal-development. It is argued that the relative growth of services is unhealthy because it reflects the lack of economic development, as population pressures induce people to leave the unproductive primary sector. They migrate to the cities but cannot be absorbed into the secondary or manufacturing sector. Consequently, they must become street peddlers, domestic servants or other jobs of low productivity characteristic of the tertiary sector. While the theoretical and empirical adequacy of this conception of tertiarization can be questioned (Browning, 1972), undoubtedly there are significant differences between developed and developing countries in the nature of the movement into the Service sector. We introduce this diversion from the discussion of the U.S.A. to show that there is no invariant "evolutionary" sequence for the development of services. Even though they are increasing as a proportion of the labor force in virtually all countries, there are important difference in how they develop.

What has been said in the last several pages should have made sufficiently clear the fact that our understanding of the nature of the transformative process and the emergence of services as the predominant form of employment is imperfect at best. We have only a general idea of the sources or causes of this transformation. Unfortunately, relatively few persons have elected to follow up the leads that Kuznets opened in his general comparative studies, and we lack detailed and rigorous analyses of the various facets of the process.

Even more, we are unclear as to what are the important consequences of the transformative process. Because of the recency of the emergence of the service economy and service society, it is not always easy to recognize and properly interpret the various consequences. One might expect a good deal of help from the futurist literature, but as a whole it has not been very illuminating, except in the most general way. We suspect there are important consequences that we still have not "seen" as yet, and when they are recognized the importance of services will be more fully appreciated.

In addition to the uncertainties about the causes and consequences, we still don't comprehend well the mechanics of the transformative process itself, how this happens and the forms it takes. The greater part of this report is taken up

with this problem. Little attention is given to the causes of the transformation or to its consequences, although in the final chapter we shall briefly review some of the effects of the process.

THE PROBLEM OF SECTORAL ALLOCATION OF INDUSTRIES

Before we proceed further, it is necessary to confront a perennial problem that bedevils all efforts to deal with sectoral transformation: the allocation of specific industries to specific sectors. Any classification scheme, to be sure, should not be considered as an end in and of itself, but rather as a means toward some goal. In this case, however, the sectoral allocation scheme is very important because of its effect upon subsequent analyses. This is particularly so because there exists no consensus, derivable from a theoretical base, on how industries should be allocated. Fuchs (1968:15) notes that "The two criteria most frequently mentioned are closeness to the consumer and the presence or absence of a tangible product," but he immediately comments on the difficulties of applying these criteria. Services ought to be closest to the consumer, yet many activities generally classified as services (e.g., advertising, wholesale trade, bulk transportation, and some government services) do not deal directly with the consumer. And not all forms of services (shoe repair or a dental brace) are intangible.

In order to conduct the analyses reported in subsequent chapters of this monograph, some sort of parsimonious industry classification scheme is required. Preferably, this scheme should be formulated so as to be consistent with interpretations of sectoral transformation and economic development. The most familiar of existing schemes is the Fisher-Clark three-sector model. While the idea of a tripartite division of industries can be traced back as far as the Swiss census of 1888 (Menz, 1965), it was the scheme advanced by A.G.B. Fisher (1935) and Colin Clark (1940) that became widely disseminated. The Fisher-Clark classification is made up of the following three sectors:

1. Primary industries (agriculture, mining, fishing and forestry).
2. Secondary industries (manufacturing, construction and utilities).
3. Tertiary industries (commerce, transport, communication and services).

The Fisher-Clark formulation is more than a classification scheme; it is also a model of development. In the words of Postan (1971:86), "In Clark's formulation the tripartite order of sectors was transformed from a mere classification into an itinerary of economic progress. The lesson he taught was that economic progress had been achieved in the past and was to be achieved in the future by transferring resources first from primary occupations to secondary ones and, finally, from secondary to tertiary ones." Fundamentally, the motor that drives the transformative process is productivity. Thus, the key feature is the transfer of employment from industries with low productivity to those with high productivity--namely, from the primary sector to the secondary sector, or mainly from agriculture to manufacturing. However, the movement from secondary to tertiary employment is not a consequence of the higher productivity of the latter. Rather, it is the high level of per capita income that manufacturing generates that makes possible the demand for a variety of services.

The Fisher-Clark thesis has been subjected to various criticisms; i.e., the primary sector is not always low in productivity, and the sequence of employment enlargement is not always from primary to secondary but may be from primary to tertiary (Bauer and Yamey, 1951 and 1954; Triantes, 1953). There is, however, one criticism that is central to the task of developing a classification scheme; the heterogeneity of activities carried on within the tertiary sector. As long as the tertiary sector was small in size this could be tolerated, but with one-half or more of the labor force in this one sector the inadequacies of the three-sector scheme have become more and more intolerable. Consider only the differences between banking and domestic service, between medical and health services, and barber and beauty shops, or between accounting and entertainment. What do these services have in common? These industries differ along many dimensions, be it capital requirements, size of establishment, educational attainment of those employed in them, etc. While some service industries are positively associated with rising per capita income, others show a negative association. Clearly, services has increasingly become only a residual category.

Despite the many criticisms the Fisher-Clark model has received, it continues to be much used, once again testifying to the adage that criticism in itself, however telling, does not bring about the replacement of one conceptual scheme by another. To cite only a few of the recent examples of the usage of the three-sector model: Kuznets (1971) and Fuchs (1968) in economics, Miller in demography (1972), and Bell (1973) in sociology.

The sectoral allocation scheme developed by Browning and Singelmann (n.d.) and used in this monograph is presented not as a solution to all of the theoretical problems inherent in such a task, but simply as an advance over the Fisher-Clark formulation. Therefore, it deliberately is a modification and refinement, rather than a completely new formulation. It has been developed with data of the U.S.A. and therefore may not be as universal as one made up for countries of markedly different development or of different political systems. It is a six-sector scheme, designed to preserve some of the advantages of dealing with a limited number of aggregate categories. (Surely the population of the old three-sector scheme was due in part to its simplicity.) However, in recognition of the importance of within-sector variation, particularly since this is a relatively untried scheme, most of the analyses to follow break the six sectors down into 37 more detailed industries that allow much greater homogeneity of category.

The primary intent of the six-sector scheme of Browning and Singelmann, as presented in Table I-1, is to differentiate the Tertiary sector into more homogeneous units. Consequently, the first two sectors, here called Extractive and Transformative, are the same as the Primary and Secondary sectors of the Fisher-Clark scheme, even though some changes could have been made. For example, it is arguable that mining should be shifted from the Extractive to the Transformative sector, for in many respects (size of enterprise, capital investment, unionization, etc.) mining enterprises more closely approximate the organizational features of productive units in the Transformative sector. And within the latter sector, construction presents difficulties, because its mode of organization differs from the factory form that is

Table I-1

ALLOCATION SCHEME FOR SECTORS AND INDUSTRIES

I. EXTRACTIVE
1) Agriculture, Fishing and Forestry
2) Mining

II. TRANSFORMATIVE
3) Construction
4) Food
5) Textile
6) Metal
7) Machinery
8) Chemical
9) Miscellaneous Manufacturing
10) Utilities

III. DISTRIBUTIVE SERVICES
11) Transportation and Storage
12) Communication
13) Wholesale Trade
14) Retail Trade (except Eating and Drinking Places)

IV. PRODUCER SERVICES
15) Banking, Credit, and Other Financial Services
16) Insurance
17) Real Estate
18) Engineering and Architectural Services
19) Accounting and Bookkeeping
20) Miscellaneous Business Services
21) Legal Services

V. SOCIAL SERVICES
22) Medical and Health Services
23) Hospitals
24) Education
25) Welfare and Religious Services
26) Nonprofit Organizations
27) Postal Services
28) Government
29) Miscellaneous Professional and Social Services

VI. PERSONAL SERVICES
30) Domestic Services
31) Hotels and Lodging Places
32) Eating and Drinking Places
33) Repair Services
34) Laundry and Dry Cleaning
35) Barber and Beauty Shops
36) Entertainment and Recreational Services
37) Miscellaneous Personal Services

NOTE: See Appendix B for the identification of the 37 industries from the 1/100 Public Use Samples of 1960 and 1970.

typical in the Transformative sector. Since it doesn't fit much better in any other sector it was left in the Transformative sector.

The first of the four sectors that make up the old Tertiary sector is called the Distributive sector. It is the last of a three-stage sequence (Extraction-Transformation-Distribution) that signals the processing of goods from their most undifferentiated "primary" form to their distribution to the ultimate consumer. (Characteristically, this sequence is not a completely tidy one, for communication rarely deals with a tangible product.) The remaining three sectors cannot be linked to the sequence of the first three sectors, for they offer generally intangible services either to productive organizations in all other sectors or to the general public and as they cannot be ordered to form a sequence in their own right.

The fourth sector, Producer services, is made up mainly, if not exclusively, of industries that provide services to producers of goods or to individuals concernd with various forms of property. Producer services has been growing very rapidly in recent decades, partly because it did so from an initially small base. As pointed out by Fuchs (1968), activities such as accounting and advertising once were performed within firms, most often those in manufacturing. The emergence of these activities as separate industries is a reflection of the increasing division of labor. It also is linked to economies of scale, external economies, and in general to the greater degree of interdependence characteristic of a metropolitan-dominated form of economy.

Both Distributive and Producer services can be characterized as "goods-oriented" services, because they cater largely to goods or property as such or to matters related to property. They also can be characterized as "intermediate" sectors, between the first two "production" sectors and the last two "consumer" sectors. The last two sectors, Social and Personal services, are very predominantly "consumption-oriented." As such, they cater principally to the individual in some fashion, but it is precisely the different forms through which these services are rendered that necessitates their differentiation into two sectors. The fifth sector, Social services, includes health and medical, education, and government as its principal components. These services are "new" to the extent that their mass consumption is a relatively recent phenomenon, and the funds for their operation are dependent to a considerable degree on government revenues. In one form or another countries throughout the world, whatever their level of development, have responded to the exigencies of the welfare state by increasing the range and depth of their Social services. As such, this sector has largely a collective focus.

The last sector, Personal services, is the most heterogeneous of all sectors and the most like a residual category, but the services in this sector have in common an orientation to the individual consumer, and they are more responsive to supply and demand factors than are Social services. Generally, the size of establishment is relatively small, much more so than for Social services.

The Browning-Singelmann classification scheme was developed heuristically, for it was not derived from some theory of development, but rather from a dissatisfaction with the Fisher-Clark scheme. It was generated the better to understand

the sectoral transformation of the labor force. Although worked out on the basis of data from the U.S.A., Singelmann (1974) has successfully applied it to six other developed countries (Canada, England and Wales, Germany, France, Italy and Japan) in a longitudinal study. It also has been used by Munoz (1975) and Oliveira (1975) in studies of the labor force of the largest metropolitan area (Mexico City) in a developing country, Mexico.

There is another basis to appraise the Browning-Singelmann scheme. Recently, and completely independently, two researchers in other parts of the world--Katouzian in England and Singer in Brazil--formulated sectoral allocation schemes. Katouzian (1970) entitled his article "The Development of the Service Sector: A New Approach," and he too was led to his categorization by his dissatisfaction with the Fisher-Clark scheme and its failure to differentiate the tertiary sector. But Katouzian maintains that the new classification can illuminate the developmental process. He divides the tertiary into three sectors: 1) complementary services; 2) new services, and 3) old services. The "complementary" services include banking, finance, transportation, wholesale and retail trade. Historically, Katouzian (1970:366-367) sees complementary services as closely linked to the rise in manufacturing following the Industrial Revolution:

> These services have been complementary to the growth of manufacturing production in two ways: as complementary factors to urbanization, and as necessary links to the process of round-about or capitalistic production. The growing demand for labour in industrial centres attracted migrants to urban areas, and factory production necessitated a high degree of urbanization. The growth of round-about production increased the range and complexity of intermediate goods and (with the underlying specialization process that was taking place) helped the conversion of local markets into a unified national market and expanded foreign trade--all demanding services included in this category. Therefore, as the rate of growth of industrial production increased, so did the rate of growth of these services, and vice versa.

The "new" services include education, health and entertainment. They are termed "new" because they reflect the mass consumption in industrial countries.

> The demand for these services is highly sensitive to the growth of per capita incomes, and it is also an increasing function of the amount of per capita leisure-time (especially if the community curve of the distribution of leisure time is not lopsided). (Katouzian, 1970:366).

Finally, the "old" services are those that "flourished before industrialization and whose importance and contribution has almost continuously declined since." Katouzian specifically includes domestic service but is quite vague on what other industries are to be included. It is likely that he has in mind what we call Personal services.

Paulo Singer, working within the context of a developing country, has provided a framework for sectoral analysis in his Forca de trabalho e emprego no Brasil 1920-1969 (1971). He stresses the need for a broad interpretative approach ("structuralist-historical" as it now is known in Latin America) to understand changes in

the labor force of Brazil for half a century. Also recognizing the need to deal with the heterogeneity of the tertiary sector, Singer divides it into three sectors:

(1) Production Services (commerce, transportation, communication, warehousing);
(2) Collective Consumption Services (government, health, education and other social services);
(3) Individual Consumption Services (liberal professions, domestic services, repairs and other personal services).

Singer shows in his longitudinal analysis of Brazil that each of these sectors had periods of relative strength and decline and like Katouzian he links these changes to those of the economic productive structure.

It strikes us that there are general similarities in the breakdown of the tertiary sector by Katouzian, Singer and Browning-Singelmann. The labels differ but the three classifications can be ranked as follows:

	Browning-Singelmann	Singer	Katouzian
1.	Distributive Producer Services	Producer Services	Complementary Services
2.	Social Services	Collective Consumption Services	New Services
3.	Personal Services	Individual Consumption Services	Old Services

Recalling that these allocations were made completely independently of one another, it is encouraging to find such a similarity in approach, even though there are differences in the allocation of specific industries to the sectors.

While it is encouraging to find others headed in the same direction, the best test of the utility of the Browning-Singelmann classification is how well it works when applied to actual data. In the pages that follow the reader will have ample opportunity to judge for himself how discriminating the scheme is when applied to the U.S. data, and how useful it is in permitting meaningful interpretations of the results.

THE ORGANIZATION OF THE STUDY

The perspective adopted in this analysis of the sectoral transformation of the labor force derives mainly from demographic and sociological origins and not from an economic one, except as it pertains to the analysis of the income distribution. Although it may be touched upon from time to time, particularly in Chapter II, the question of why the sectoral transformation occurred as it did--why some sectors and some industries grew while others declined--cannot be a central theme of this

investigation. To do so would take us more fully into the realm of economics and a consideration of such factors as private and public sector investment allocation, the role of technology, of productivity, of labor demand and supply, and so on.

These are very important matters, but not ones we are competent to deal with. Nor, for that matter, is the nature of our main source of data appropriate for such a task. We depend, to a very large extent, upon the U.S. Bureau of the Census 1% Public Use Samples for the census years of 1960 and 1970. They are population censuses and not censuses of industries. Therefore, we have no indicators of investment on output but only of the employed labor force.

But what can be done with the labor force? A great deal, as we hope to demonstrate. Fuchs has expressed it as follows (1968:183): "A million dollar's worth of capital input can be said to have as much economic significance as a million dollars' worth of labor input. But labor is human and physical capital is not; it is appropriate, therefore, to give labor primary attention in any broad study concerned with total social development."

This report is organized to consider a series of distinct but interrelated questions: 1) How is the sectoral allocation to be made? 2) How is the long-term (1870-1970) and short-term (1960-1970) sectoral transformation to be depicted? 3) What is the relationship between industries and occupations? 4) Which characteristics of the labor force (primarily age, sex and ethnic status) are associated with which sectors and industries and how have their patterns changed between 1960 and 1970? Finally, 5) what are some of the consequences of sectoral allocation and sectoral change, specifically, for income distribution on the one hand and the nature of work and its meaning on the other?

Perhaps the best way to expand on the points raised by these questions is to show how they will be treated in subsequent chapters of this report.

Chapter II briefly provides the historical context for the more detailed analysis of the 1960-1970 period. The more one goes back in time the more unsatisfactory the data become, but it is possible to approximate the distribution of the six sectors for one hundred years. With this record we can show the movement out of the primary sector (already underway by 1870) and to show when the growth of the service sectors really accelerated. We can also relate these trends to the relevant changes in urbanization, output and female employment. In this way some of the questions raised by Katouzian and Singer can be put to the U.S. experience.

Chapter III takes up the present-day situation as reflected in the 1960 and 1970 data. First, we must address an important question that relates to the sectoral transformation, especially, into that of services. It has often been noted that services are characterized generally by more part-time work than other sectors. Conceivably, therefore, the large shifts into the services could be misleading, for while there are important changes in <u>employment</u>, these changes may

greatly be reduced if the actual labor input is taken into account. This can be done by deriving the yearly hours per worker, a combination of hours per week and weeks per year. This is computed for the six sectors and for the 37 sub-industries.

The second part of Chapter III takes up a different topic but one, like the question of employment versus labor input, that is relevant to material in subsequent chapters. Is the sectoral transformation primarily a change whereby people move from one industry sector to another, or is it mainly the result of a larger proportion of new labor force entries going into some rather than other industries? Unfortunately, census data do not permit a full test of this matter, but the questions new to the 1970 census on what the individual was doing five years ago provide some findings that bear on the problem.

Chapter IV, like the preceding two, is concerned with a structural feature of the industry sectors and their transformation. The primary objective is to determine how the 1960-1970 change was achieved through specific age groups. Age distributions for the two periods are examined and age-sex pyramids graphically indicate the many forms the age distribution can take, but the major technique is net shift analysis, which permits comparison of expected versus actual age group changes. As with the inter-employment shifts we wish to know, once we control for the growth of the entire labor force in every one of the age categories, whether the proportionate growth of some of the service sectors is accomplished mainly through the young entrants or whether it is diffused throughout all age groups?

Chapter V is the final chapter in the structural section of the report. Here we take up the difficult problem of the interrelation of industry and occupation. It is strange that so little attention has been given to the problem, for it would appear obvious that changes in industry structures should be reflected in occupational structures and vice versa, but, exception for a few cases, the industry and occupational structures are considered separately rather than jointly. Following the lead of Palmer and Miller (1949) the change in the occupational composition from 1960 to 1970 is decomposed into three components: 1) that attributable to growth of the total labor force (were the 1960 occupational composition to hold for 1970); 2) that attributable to the industry shift effect (the differential demand for occupations by industries growing at different rates); and 3) the occupational shift effect (the changing occupational requirements within industries). This approach, which is a variation of the shift share approach used in Chapter IV, does not exhaust the subject, but it is believed to be a step in the right direction.

The first five chapters concern themselves to a large extent with the nature of the sectoral allocation and the "how" of its transformation. They are largely descriptive in nature but they are not "merely" descriptive, for it is essential that we know how a thing works if we are better to understand its interrelationships and its consequences. The next two chapters are concerned with the compositional features of sectors, the "who" aspect.

Chapter VI takes up the sexual division of labor by sexes, a topic of much contemporary concern and one especially important for the analysis of services. As will be shown, female employment is largely concentrated in services, particularly the Producer, Social and Personal sectors. Particular attention is devoted to the

question of whether the increasing concentration of women in service industries has provided greater opportunities for entry into higher-status occupations. The distinction between occupational and industry sex-typing is made and the consequences for women's work is drawn.

The following chapter on minorities (VII) continues the crucial matter addressed to females: to what extent does the sectoral transformation of the labor force improve the work status of minorities? The main analysis is carried out for black-white relationships by sex, but at the end of the chapter a comparison of two minorities who are of roughly comparable socioeconomic status, Blacks and Mexican Americans, is made. This last examination is limited to the five Southwestern states, because these are the states where Mexican Americans mainly are found and where data for them are available.

The eighth chapter addresses a most important problem: the extent to which the shift of employment towards Social and Personal services and its accompanying changes in terms of occupational structure and the position of females and minorities in the labor force are reflected in the distribution of earnings. First, the change in earnings inequality between 1959 and 1969 will be described. Second, the relative merits of the human capital and the sectoral approaches as competing explanations of the observed changes are assessed. Finally, we will analyze the differences in the returns on the variables in the human capital model as applied to industries by sex and race.

Like Chapter VIII, the final chapter of the report, IX, is concerned mainly with some of the consequences of the sectoral transformation. Rather than attempting a summary of what has gone before in the first part, we elect to reconsider some of the more important findings in terms of their implications for manpower policies.

A second section of Chapter IX is frankly speculative in nature, for it moves more completely into a sociological consideration of the sectoral transformation of the emergence of the service society, a consideration that necessarily goes beyond the data of the report. As such, it is intended to show the possibilities of relating industry sectors with social structure through such factors as the nature of social interaction when consumers must cooperate in the production of a service, the impact on the class structure when two-thirds of the labor force are in services, and the meaning of alienation within the context of a service society.

Chapter II

THE HISTORICAL CONTEXT OF THE SECTORAL TRANSFORMATION, 1870 to 1970

Social and economic changes are general phenomena of all countries and all times but they do not automatically occur within convenient time-spans such as census intervals. Thus, while it is useful to examine certain changes for a given time period, these changes often have started at an earlier time and do not always terminate at the end of the period that is under investigation. The purpose of this chapter is the discussion of the labor force changes during the last one hundred years in the context of which the 1960-1970 decade can be seen. This is not to say that every change that occurred in the structure of the labor force during the 1960's began toward the end of the last century. That certainly would be an erroneous assumption. The point here is that the ten-year period which we put under the magnifying glass of our investigation should not be seen in isolation but rather in its historical context. To this end, we shall sketch a general outline of the changes which the labor force has undergone, primarily in terms of its industry and occupational structure. In addition, other aspects related to these changes, such as urbanization and the increased labor force participation of women, will briefly be addressed. This is not the place, however, to account for the reasons for the way in which the structure of the labor force became transformed. This in itself would be an investigation in its own right, but more important, we do not think that our tools could satisfactorily accomplish that task. Instead, the reader is referred to studies that have addressed this subject (e.g. Kuznets, 1966; 1971; Abramovitz, 1956; Bain, 1966; Denison, 1967; Fabricant, 1942; and Kendrick, 1961).

Before turning to the analysis of the sectoral transformation of the labor force between 1870 and 1970, a word of caution must be said about the nature of the labor force data reported in Table 1. Census data for the industry allocation of the labor force prior to 1920 are very general and do not provide information on the level of detailed industries. The best time series for the distribution of the labor force by industry prior to 1920 has been reconstructed by Salomon Fabricant and it forms the basis of Table II-1. Even these data, however, are too crude to permit an exact differentiation of the labor force into the six industry sectors used throughout this study. But they at least indicate the magnitude of most industry sectors for the 1870-1920 period.

The sectoral transformation of the labor force. In just one hundred years the labor force of the United States changed from an agricultural basis to a service basis. In 1870 one-half of the labor force worked in agriculture, but a century later services together accounted for almost two-thirds of total employment. How did this transformation occur? The description of these changes is the subject matter of this section.

By 1870, stimulated by the Civil War, the industrialization of the U.S. economy was well under way. The expanding rail transportation network had opened up additional territories and facilitated exchanges between the states. A national banking system was created permitting a less restricted flow of capital. As Bagwell and Mingay (1970: 165) pointed out, however, it was most of all improved

technologies and their application to the vast natural resources of the nation that propelled the growth of the U.S. economy during the last third of the nineteenth century.

The move out of agriculture is one of the most striking features revealed in Tables II-1 and II-2. Once it began, it continued unabated throughout the century, and actually has accelerated since 1940. By 1970 only 3.7 percent of the nation's labor force was engaged in agriculture. Considering the fact that these 2.7 million people not only provide food for 205 million Americans, but also for persons living in many other countries, the decline in the need for agricultural labor must remain one of the greatest achievements in economic development. It demonstrates how mechanization, innovations in fertilizers and seeds, credit and concentration of land ownership have enabled continuous increases in productivity to take place.

In contrast to some other countries in Western Europe, such as Belgium or Germany, the labor force in the United States has never been dominated by the Transformative sector. At no time since 1870 did the Transformative sector account for more employment than the service industries taken together. In fact, the ratio of service employment to Transformative employment increased substantially, from 1.03 in 1870 to 1.56 in 1970.

In general, the share of total employment in manufacturing expanded during each census year since 1870, although the growth was not always substantial. During the 1960's, however, employment in manufacturing industries has increased less rapidly than the total labor force. Since this trend already started in Canada during the 1950's, there is reason to believe that around 1960 manufacturing reached its largest share of total employment. From now on manufacturing is likely to account for a slightly decreasing proportion of the labor force.

But the changes in the share of employment in the Transformative sector reveals only half of the story. The data in Table II-3 demonstrate that manufacturing production has increased much more remarkably since 1870 than manufacturing employment. Moreover, the rate of increase in manufacturing production during the 1960's exceeded that of the previous decade, despite the fact that the growth rate of manufacturing employment declined during that period. Although the emphasis of this project is on the changes in employment, the data for manufacturing production suggest that output and productivity trends of a particular industry are not always exactly reflected in employment trends. As was noted in the case of agriculture, the number of persons employed in a given industry does not always correspond to the magnitude of its outputs.

We now turn to the discussion of the growth of services and their differentiation during the last one hundred years. In 1870 domestic service was the largest single service industry; it employed twice as many persons as did all Social services together. Over the decades, however, the structure of service employment underwent fundamental changes.

We noted in the first chapter that Katouzian (1970) viewed Distributive and Producer services (the "complementary services" in his terminology) as being closely linked to the production industries of the Extractive and Transformative sectors. These services are, for the most part, of an intermediate nature

TABLE II-1

PERCENTAGE DISTRIBUTION OF GAINFUL WORKERS BY INDUSTRY SECTORS AND MAJOR INDUSTRY GROUPINGS: UNITED STATES, 1870-1920

Industry Sectors and Major Industry Groupings		1870	1880	1890	1900	1910	1920
I.	EXTRACTIVE	52.3	52.4	45.2	40.7	35.0	30.6

(Greenfield, 1966; Machlup, 1962). They primarily cater to establishments of other industries and do not serve the individual consumer directly. It must be noted, however, that this characterization fits some Distributive and Producer services (such as transportation and advertising) better than others (e.g. retail trade).

With the expansion of the manufacturing sector, the demand for these services increased as well. Consider the example of transportation. A good transportation network has often been mentioned as a necessary condition for successful industrialization (e.g., Davis, et al., 1972; Easterbrook and Aitken, 1956; Dillard, 1957). But the increased demand of manufacturing industries for transportation to move their products was a strong impulse for expansion. To that extent, then, the growth of employment in transportation during the 1870-1920 period reflects the extension of the transportation network as well as the increase in the demand for transportation by the new and expanding industries primari within the manufacturing sector.

But, as Table II-2 shows, transportation did not continue its relative growth in employment during the 1920-1970 period. While the first fifty years (1870-1920) saw a doubling of transportation's share of the total labor force, the next fifty saw a large, if uneven, decline. Two reasons can be given for the decline. For one, the last fifty years brought with them a drastic change in the nature of transportation. It was during this time that the automobile became the favorite mode of getting from one place to another. As a result, the transportation of persons by public means became less important. Second, once a comprehensive transportation network is created -- this is particularly true for railroads -- it is capable of handling large increases in demand without corresponding increases in employment. This is to a large extent the result of technological advances, which permit various economies, thereby increasing productivity many times (see Cottrell's article (1951), "Death by Dieselization," as a good example for the influence of technology on transportation).

The relationship between the Transformative sector and the various Distributive and Producer services is quite complex and differs from one industry to the next, although in general their growth is linked to the development of Transformative industries. Communication industries, for example, have increased their proportion of the labor force continuously, but owing to their being a high capital-intensive industry, labor is relatively unimportant.

The growth of employment in trade, rising from about 6% in 1870 to 17% in 1970, is one of the more impressive changes in Tables II-1 and II-2. The reasons for this proportionate gain is not immediately obvious, since it could be assumed that trade would simply maintain its relative share of the labor force but would not nearly triple its share.

The century under consideration witnessed the full emergence of the U.S.A. as a mass consumer society and trade has been the means by which the enormous growth of production in both the Extractive and Transformative sector has been delivered to the consumer. This linkage between trade and the production of goods indicates that it must not necessarily be labor that is related but it often is output. As long as goods are produced, they need to be sold. In this sense, it matters relatively little how many persons the Transformative sector employs. As we pointed out above, the proportionate decline of employment

in the Transformative sector during the 1960's, for example, has not meant that output during that time declined.

Although the data for Producer services are very limited for the time prior to 1920, its development nevertheless is most interesting, for it points to an additional aspect of the sectoral transformation of the labor force: the division of labor. A great deal of work that now is performed by the various Producer services originally was carried out within goods-producing industries themselves. Advertisement is a good example. In the early part of the industrialization process, firms who wanted to advertise used their own employees to do so. As advertising became more important, both in terms of its impact on sales and as proportion of the firm's budget, it also had to become more specialized. Once the demand for this service could guarantee a certain volume, advertising was established as an independent industry. Other Producer services such as accounting and bookkeeping fit the example of advertising very well.

Most impressive, however, was the employment growth of Producer services during the 1950-70 period. In these two decades alone, they increased their share of the total labor force by over 80 percent. This impressive growth rate, in part, was due to the expansion of banking and insurance services and their aggressive attempts to gain as many customers as possible. Fifty years ago few people had personal checking accounts and the familiar "charge-it-on-your-credit-card" was not yet part of the American way of life. It therefore is not surprising that according to Greenfield's (1966) estimate, over-half of the employment in banking and insurance serves individual consumers, whereas the remaining employment caters to other establishments. Again, the continued expansion of <u>all</u> Producer services during the 1960's occurred while employment in the Transformative sector decreased in proportionate terms. The growth of employment in the Producer services sector is, as in the case of trade, not dependent on the share of employment in the Transformative sector. In effect, part of the proportionate decline of Transformative employment could be the result of the division of labor that has favored the expansion of Producer services.

Remarkable as was the growth of Producer services after 1950, it is surpassed by the expansion of Social services. The trends of these two service sectors are very similar: although they increased their share of total employment during each decade over the past one hundred years, their main growth came during the 1950-70 period. In 1970 Social services accounted for 22 percent of the total labor force and by 1980 one of every four employed persons can be expected to work in this sector.

The four largest industries in the Social services sector are medical and health services, hospitals, education, and government. It was pointed out in the introductory chapter that Social services correspond to Katouzian's (1970) "new services." These services are new in the sense that they have become available to most parts of the population. This does not mean, however, that all population groups have <u>equal</u> access to health services and education; socioeconomic differentials still prevail. But in earlier times these services were available only to the privileged classes, and the vast majority of the population was excluded. As Table II-2 shows, the big expansion of medical, health, and educational services is very recent; it was during the 1950's and 1960's that they became accessible to more and more people. Social welfare legislation growing out of the New Deal, the Great Society programs of the

Kennedy and Johnson Administrations, and the Civil Rights legislation, all have contributed to the expansion of employment in these services.

Besides these more centrally directed and planned influences on the growth of Social services, a very important factor has been the rising per capita income of the United States population (see Table II-3). As per capita increased, the disposable income of individuals became larger which enabled people to spend larger proportions of their budget on items such as health care and education. This situation is not specific to the United States, but exists in the industrialized countries in general. For example, it was found in a study of seven industrialized countries that the proportion of total employment in Social services is positively related to per capita income (Singelmann, 1974). As per capita income continues to grow, we can expect the demand for Social services to increase also, although it is not likely (if only because of technological advances in the Social services themselves) that the share of total employment in Social services will expand beyond thirty percent for some time.

Finally, Personal services, the "old services" in Katouzian's (1970) scheme, experienced very uneven growth rates during the last hundred years. But this situation primarily is the result of the decline of domestic service from 7.4 to 1.7 percent of the total labor force. In contrast, the remainder of the Personal services sector expanded in almost all decades of the 1870-1970 period. Thus, Katouzian's (1970) statement that in the course of economic growth the share of the labor force in old services declines, mainly pertains to domestic services (although some other personal service could be included). But two Personal services differ from this trend: hotels and lodging places, and eating and drinking places. Both service industries increased their share of total employment from 2.9 percent in 1930 to 4.3 percent in 1970. By 1970 they accounted for almost one-half of all employment in Personal services, excluding domestic service.

Hotels and eating places respond similarly to increases in per capita income as do Social services. Once the disposible income of individuals reaches a certain level, the service of preparing food, for example, can be afforded especially food sold through quick-order outlets. In that sense, the emergence of these Personal services reflects the continued division of labor whereby less and less work is performed in the household itself, and more labor is done within formal organizations.

The preceding discussion not only showed how the labor force during the past one hundred years have become overwhelmingly non-Extractive, but it was noted that among the non-Extractive industries, important changes took place. By far the most dynamic industries in that time period were the Social and Producer services. Since this trend is a relatively recent one, it can be expected that it will continue through 1980 at least, although the rate of expansion is likely to slow down as compared with the 1950-1970 period.

The occupational structure. The complex and sweeping changes in the industry structure of the labor force during the past one hundred years have brought with them fundamental changes in the type of work that people do. This is not the place to elaborate on the nature of the interdependence of the industry structure and the occupational structure (that discussion is the subject of Chapter V in this report). The following examples may therefore suffice for a

demonstration of how changes in the industry structure can be related to occupational changes. As a consequence of the continuous decline of agriculture, fewer and fewer farmers and farm laborers were needed in the labor force. Similarly, as Social and Producer services expanded in this century, professional, clerical, and service occupations also experienced a disproportionate rate of growth. This section examines the changes in the occupational structure of the labor force since 1900. The discussion should help to put the analysis of the relationship between industry and occupation within its historical context.

In 1900 farm workers made up almost two-fifths (37.9 percent) of the labor force (Table II-4). One-third (35.8 percent) of the labor force consisted of manual workers. White-collar occupations made up only 17.6 percent of total employment. Particularly noteworthy was the small share of employment (only 3.0 percent) in clerical occupations in 1900.

Within seventy years the character of the labor force changed from the domination of blue-collar and farm occupations to a concentration of employment in white-collar positions. Consider the following changes: farm workers as proportion of total employment decreased by about 90 percent; professionals almost quadrupled; and clerical occupations increased six times, to become the single largest occupational category. The only occupational category outside white-collar work that increased its share of total employment continuously during the past seventy years was service workers other than private household, and this category is found mostly in Personal and Social services. In 1970 white-collar occupations for the first time employed more persons than manual and service occupations combined; almost one-half of total employment was in professional, managerial, sales and clerical positions.

Manual occupations, in contrast, have been growing more slowly than total employment since 1950. The proportionate decline of laborers is the clearest; their share of total employment has decreased steadily since 1900; there were fewer laborers in 1970 than 70 years earlier. With the growth of employment in the Transformative sector until the sixties, craftsmen and operatives grew more rapidly than total employment.

Although the foregoing discussion clearly shows that the growth of services contributed significantly to the expansion of white-collar occupations, there are also occupational changes within industries that are reflected in the overall changes in the occupational structure. Certainly, the occupational requirements of a certain industry change over time, for example in response to technological advances.

Urbanization. One of the most pervasive consequences of the sectoral transformation from agricultural to service employment is urbanization. As agricultural work declined, people left the farms and migrated to the cities. This movement is clearly reflected by the data in Table II-5: the percent urban of the total population increased from about one-quarter to three-quarters of the population.

The subject of urbanization is too broad a topic to be discussed here in all its dimensions, and much valuable information about it is readily available (e.g., Taeuber and Taeuber, 1971). However, one aspect needs to be

TABLE II-4

PERCENTAGE DISTRIBUTION OF THE LABOR FORCE BY MAJOR OCCUPATIONAL GROUPS, 1900-1970

Occupational Groups	1900	1910	1920	1930	1940	1950	1960	1970

Note: The definition of "urban" changed in 1950.

addressed here and that is the urban character of services. Services, even more than Transformative industries, are concentrated in urban areas. The urban character of services is, to a large extent, due to the fact that services generally cannot be stored and transported. Although manufacturing industries, too, prefer to be located so as to have access to consumer markets, the cost of transportation is only one factor among other considerations, such as availability of labor, resources, and tax laws. In the case of services, most of these considerations do not apply. Due to the intangible nature of most services, they must be consumed at the moment of production, as in the case of education or medical services. (There are certainly exceptions to this generalization, the case of insurance companies being one of them, but on the whole this characterization fits.) With an increasing population, many services become specialized. A city needs a certain population site before an airport becomes viable. While small communities at the most have a general hospital, larger urban centerscan support more specialized medical services such as a burn-treatment center. Education in general follows a similar rule. The main exception to this is the location of some state universities, which often are located in relatively small places, such as Bloomington, Indiana or Boulder, Colorado. But in many of these cases, the decision to locate a university in a certain community has been politically determined, and does not always reflect the interplay of supply and demand.

Women in the labor force. The last years have seen a tremendous increase in the number of studies on women in the labor force (see Chapter VI for a more detailed discussion of this subject). Many of these studies undoubtedly had been motivated by the fact that the percent female of total employment has increased very remarkably during the past fifty years (Table II-6). The fact of the increased labor force participation touches upon the sectoral transformation insofar as women are much more concentrated in services than in any other industries. It is not only in Personal services that the percent female of total employment exceeds that for the entire labor force; the same is true for Social and Personal services. Moreover, the concentration of women in services has increased rather than decreased over time. The reasons for this are not all that clear, particularly since this high concentration is not to be found in many other industrialized countries (Singelmann, 1975). As Fuchs (1968) noted, services are characterized by a higher degree of part-time work than Transformative industries. Since women account for a disproportionately high share of part-time work, they might prefer to work in services. On the other hand, following the reasoning of the dual labor market theory, one could argue that women are channelled into services owing to the perceptions employers have of women. Whatever the reasons, the concentration of women in service industries is impressive, and it will be discussed in detail in Chapter VI.

Before turning to the various aspects of the sectoral transformation of the labor force during the decade from 1960 to 1970, as outlined in the introduction, we need to address one additional question: To what extent were the 1960's an exceptional period? This has an important bearing on the extent to which the findings of this study can be generalized.

By and large, the economy fared well during the 1960-70 decade. The Consumer Price Index increased at an average rate of 3.1 percent during the 1960's as compared to 2.1 percent in the previous decade. Unemployment also was relatively low. The average unemployment rate between 1960 and 1970 was 4.8 percent, slightly up from 4.1 percent during the 1950's. As Table II-7 shows,

Table II-6

RATES OF FEMALE LABOR FORCE PARTICIPATION AND PERCENT FEMALE OF TOTAL LABOR FORCE, 1890-1970

1970	4.9	116.3

SOURCE: 1973 Economic Report of the President. Tables C-26 (Unemployment) and C-44 (Price Index).

the unemployment rate went down from 6.7 percent in 1961 to 3.5 percent in 1969, which approximately corresponds with the build-up of the Vietnam War. By 1970 unemployment was up again to almost 5 percent. In sum, the data suggest that on the basis of the two economic indicators, unemployment and the Consumer Price Index, one can conclude that the economic trends during the 1960's were more or less a continuation of those of the 1950-60 decade.

More changes happened politically. Largely as a result of our involvement in Vietnam, the population became very divided in terms of political attitudes. Universities saw frequent demonstrations and various coalitions were formed to oppose the foreign policy of the Johnson Administration. At the same time, attention was called to the domestic problems of poverty and discrimination (Harrington, 1964). Several important social welfare programs were passed during the Kennedy-Johnson administrations (see Piven and Cloward, 1973). This legislation in conjunction with the various Civil Rights acts meant a significant progress in the situation of the nation's poor. It was also during the 1960's that the cities experienced tremendous unrest which made the need for social reforms all the more pressing.

These events are clearly unique to the 1960's. But in an sense, when is history not exceptional? Compared with many of the previous decades, however, the 1960's could be considered as relatively "normal." The 1920's were influenced by the consequences of World War I, the 1930's were the decade of the Great Depression; World War II dominated the 1940's, and its aftermath -- the Cold War -- the 1950's.

The sectoral transformation of the labor force during the 1960's represents, in its various manifestations, the continuation of a trend that had already started earlier. In that sense, then, we consider the decade from 1960 to 1970 as a useful time period for our purposes.

Chapter III

LABOR INPUT AND WORK CONTINUITY

There are many different forms of employment. Some persons, for example, work full time throughout the year, whereas others work intermittently for only part of the year. A third group still may work part time but continuously and, finally, there are those who only work part time for a few weeks out of every year. Moreover, a full time worker who is employed during the entire year does not necessarily work in the same industry for that time period but could well be employed in a number of different industries.

While the decision to work a given amount of time often is made by the worker, there are also requirements on the part of the industry. It is the purpose of this chapter to examine the differences between sectors and industries in terms of labor input and continuity of employment. More specifically, the chapter is divided into two parts: Part 1 examines the nature of work scheduling and labor input, and Part 2 analyzes the movement of employment among industry sectors for the 1965-1970 period.

PART I: LABOR INPUT AND WORK SCHEDULING

The sectoral transformation of the labor force during the past one hundred years has meant a profound change in the kind of work that is required. Half of the labor force worked in agriculture one hundred years ago, but in 1970 this industry accounted for a mere 3.7 percent of total employment. In contrast, almost two of every three persons employed today work in a service industry of one kind or another. While this trend is very clear in terms of employment, there has been some implicit doubt about the magnitude of this change in terms of labor input. In other words, the distribution of workers among industries will not necessarily correspond with the distribution of labor as measured by the number of yearly hours worked. The reason for this lies in the fact that industries differ in their utilization of labor. Some industries such as domestic service are characterized by a large proportion of part-time workers, whereas other industries require mostly full-time employment, as do most durable goods industries.

In particular, attention has been called to the fact that services are characterized by a high proportion of part-time employment. For this reason it is assumed that there is less of a concentration of hours worked in services than is the case of employment. Adam Smith, for example, noted that employment in manufacturing was much more "industrious" than that in services, referring largely to the number of hours worked (Smith, 1937: 78). According to Fuchs, services differ from goods-producing industries in part by the higher incidence of persons working 35 hours or less per week (1968: 193). And throughout his book, The Peripheral Worker, Morse (1969) alludes to the "peripherality" in the service sector.

These findings imply that despite the shift of employment towards service industries the input of labor has not followed suit to the same extent. Since this consideration has been largely disregarded in most studies dealing

with long-term changes in the industry structure of the labor force, this chapter examines the following two aspects: (1) the different work scheduling among industries, and (2) the relationship between employment and input of labor.

Work Scheduling

Morse (1969) has noted that there are many kinds of employment other than full time. In particular, it is important to differentiate between hours worked per week and weeks worked per year.

Usually, reference is made only to hours. To that end, a certain number of hours worked per week (e.g., less than 35) are chosen to distinguish between part-time and full-time work. But full-time workers, i.e., those working at least 35 weekly hours, may not work the entire year. Therefore, one needs to make an additional distinction on the basis of weeks between "continuous" employment (50-52 weeks per year) and, to use Morse's (1969) term, "intermittent" employment (less than 50 weeks). On the basis of these two dimensions, one could argue that only persons who work 35 hours or more hours per week throughout the entire year qualify as full-time employment. Besides this group, then, there exist many other types of employment (see Table III-1 for some combinations of hours and weeks). Table III-1 certainly is not exhaustive, for more sub-categories could be formed by differentiating further the number of hours.

For the purposes of the first part of this chapter, however, we will treat separately hours and weeks worked. In the second part these two dimensions of work scheduling will be combined to arrive at the total labor input.

Part-Time vs. Full-Time Employment. The incidence of part-time employment can be viewed from two different perspectives. On the one hand, some people might prefer to work only part of the regular hours because of other commitments such as schooling. This consideration is most likely to account for the high proportion of part-time employment in retail trade, particularly food stores, and eating and drinking places.

It also has been frequently mentioned in the literature that many women prefer part-time work due to other demands (children and household) on their time. In the case of women, however, the voluntary nature of part-time employment is less clear. Given the strong existence of sex stereotyping in the labor force, the explanation of the higher incidence of women working part time may well be an *ex post facto* explanation. Since the decennial census data do not include any questions concerning voluntary and involuntary part-time employment, this aspect cannot properly be addressed here, despite its unquestioned importance. (The only way, at this point, to circumvent the inadequacy of the data would involve estimates from the Current Population Surveys.)

The other viewpoint concerns the scheduling requirements of production. Certain industries are less conducive to part-time employment than others. Production processes that require a high degree of formal organization would be less likely to employ persons on a part-time basis. One example of this is the assembly line. Particularly those industries that require a large amount of capital equipment and which operate on a two or three shift basis are most likely to favor full-time employment, as in petrochemicals. Most manufacturing industries fit this characterization.

Table III-1

TYPES OF PERIPHERALITY

Type	Civilian Labor Force in 1965 (in millions)
Slightly Peripheral	
40-49 weeks, over 35 hours	6.6
Moderately Peripheral	
27-39 weeks, over 35 hours	4.7
50-52 weeks, 35 hours or less	5.4
40-49 weeks, 35 hours or less	1.5
Severely Peripheral	
14-26 weeks, over 35 hours	4.3
27-39 weeks, 35 hours or less	1.8
Extremely Peripheral	
26 weeks or less, 35 hours or less	8.8
13 weeks or less, over 35 hours	4.8
Total	37.9

Adapted from Morse, 1969:43.

In contrast, many services permit a much higher degree of part-time work. The extreme example is domestic service. Most domestic servants are hired on a part-day basis and therefore they need more than one employer to come up with at least a moderate amount of total work. But many other services, although to a lesser extent, do not depend on full time work either. Retailing, for example, can efficiently use part-time help, especially during nights and weekends. The same situation exists for eating and drinking places.

To a large extent, part-time work is related to the absence of an even and continuous level of production. In the case of services,an even level often is difficult to maintain, for they cannot be stored. Thus, if demand is uneven during the course of the day, so is production. Consider the example of eating and drinking places. The demand for these services is much higher between 11:00 am to 2:00 pm and 5:00 pm to 8:00 pm than at any other time. Establishments therefore can be expected to hire additional part-time help during these peak hours of production. These considerations are much less relevant in manufacturing, because their goods can be stored and no direct link exists between production and consumption. On the other hand, there are many services that require a much higher proportion of full-time work. Examples of this include banking and government, both of which are formally organized bureaucracies.

In general, however, it can be expected that services are more flexible in their work schedules and therefore permit a higher degree of part-time work than the Transformative sector. Among services, Personal services and trade (mostly retail trade) are more likely to have part-time employment than Producer and Social services.

The question of flexibility in the schedule of work raises another aspect which as yet has been largely ignored. In addition to part- and full-time employment there are many persons who work more than full time. Although this is found in many Transformative industries, particularly in construction, the greater flexibility of many services make it easier for them to accommodate people who work more than full time. In particular, it is expected that industries with a high degree of self-employment also will have a substantial proportion of persons working more than a standard number of hours; primarily in retailing, personal services, and eating and drinking places. On the basis of the preceding discussion, three employment categories will be examined across industries: (1) persons working less than 30 hours per week, (2) those who work 40 hours, and (3) those working more than 48 hours.

For the first group, Tables III-2 and III-3 show that women are twice as likely to work less than 30 hours per week than are males. This situation exists in all 37 industries, although the differences are less pronounced in some industries than in others.

What is striking in these tables, however, is the fact that for the relative position of industry sectors in terms of part-time work, sex does not make much of a difference. For males as for females, the Personal services sector has the highest share of part-time employment. This is mostly due to domestic service, but all Personal services are characterized by a high proportion of part-time employment. As was expected, part-time employment is very pronounced in agriculture and retail trade. For retail trade, this reflects the fact that many of the young employees are still in school and that the demand for retailing peaks at certain hours.

TOTAL LABOR FORCE	21.2	23.5	18.0	20.0	42.6	44.2	11.8	7.9	6.3	4.4

Manufacturing industries and utilities show the lowest proportion that works part time. The same situation exists for communication. Even for females, only 8.6% of total employment in communications worked less than 30 hours in 1970. Moreover, among manufacturing the three most modern and capital intensive industries (metal, machinery, and chemical) employed relatively fewer persons on a part-time basis than the remaining manufacturing industries. This supports our earlier statement that industries with a high degree of formal organization and a high capital-labor ratio are less likely to employ part-time workers than are the remaining industries.

The data in Tables III-2 and III-3 show, moreover, that by and large, part-time employment as proportion of total employment increased during the 1960's in most industries, more so for males than for females. But again, service industries were more likely to have higher proportions of part-time employment in 1970 in comparison with 1960 than were manufacturing industries.

Concerning the second group, we noted earlier that industries with a high capital-labor ratio and a high degree of formal organization tend to have more full-time employment than those industries the production of which is less structured and depends less on capital equipment. Using 40 hours per week as a standard for full-time work each day during the week, we can see in Table III-2 that the data are consistent with this postulated relationship. (The assumption made here is that persons who work 40 hours per week are employed throughout the week.) There is no way to confirm this assumption with available census data. It could be that some persons with 40 reported weekly hours work only three or four days, but they are not likely to be a significant share of the total.

For most industries, 40 hours per week is the modal category; this situation characterizes female employment slightly better than male employment. As expected, agriculture, retail trade, and Personal services have the lowest shares of employment working 40 hours per week. In addition, relatively few males work these hours in accounting and bookkeeping, legal services, and medical services. But in these cases of the latter three industries, the low proportion of males working 40 hours per week is due to the fact that more males worked over 48 hours.

The Transformative sector had the largest proportion of employment working 40 hours per week. But, again, it is primarily the capital-intensive industries that have the highest proportion of employment working 40 hours: metal, machinery, chemical, utilities, and communication. Only males in the last industry have become less likely to work 40 hours per week during the 1960's. Two other industries also tend to employ workers for 40 weekly hours: postal services (more for males than for females), and government. Work in both of these industries is highly bureaucratized, and "production" is separated largely from consumption. Moreover, in contrast to retailing establishments, for example, which cater to the demands of the consumer, most governmental agencies fix their own schedules and office hours to which the client has to adjust. Given this more regulated level of "production," the high proportion of employment working 40 hours per week in government is not expected.

Finally, the term full-time work commonly is used to distinguish this group from persons working only a small number of hours per week. But the concentration on the part-time/full-time dichotomy has ignored the fact that in

many industries a significant part of the work force are employed for substantially longer hours than the standard 40-hour week. This is important for an understanding of the work situation within services, since their generally greater flexibility in the organization of work might also permit them to employ more persons for a large number of hours per week than other industries. It thus could be hypothesized that among industries, the greater the proportion of employment working part time the higher the proportion of employed persons working more than a standard work week. To examine this relationship, we shall focus on those categories working less than 30 hour per week and more than 48 hours per week.

In 1970 the rank-order correlation coefficients for 37 industries between the percent employed less than 30 hours and the percent employed more than 40 hours are .380 (p. > .05) for males and .728 (p. > .001) for females. These results show that industries which are characterized by a large share of part-time employment also tend to have a large proportion of workers with more than 48 hours per week. This relationship is stronger for females than for males.

It was noted earlier that self-employed workers in general work more hours than persons who are employed (see Table III-4 for the variation of self-employment by industry). Thus, among industries, the higher the percent self-employed, the higher the percent working more than 48 hours. Again a rank-order correlation for these two variables was performed with the 37 industries, using the 1970 data. The coefficients are .748 (p. > .001) for males and .778 (p. > .001) for females. The results thus reveal that among industries a strong correlation exists between the percent self-employed and the proportion of employment working more than 48 hours.

These findings suggest that the previous focus on the high incidence of part-time work in services has been somewhat misleading. Although it is true that services are more likely to employ workers on a part-time basis, they also are more likely to employ persons for more than the average number of hours. It thus can be expected that the per capita total number of hours worked is not much lower in services than in goods-producing industries.

Continuous versus Intermittent Employment. In the previous section the focus of the analysis was on the number of hours worked per week in order to evaluate the employment pattern among industries along the part-time/full-time dimension. In this section we are concerned with the stability of employment over time, in this case for one year. The reader needs to be reminded, however, that the term continuous employment refers to his labor force status and not to job tenure. In other words, someone who is employed throughout the year may have changed jobs a number of times. Similarly, those working only one-half of the year are not very likely to be idle the other half; rather, they can be expected to have worked for a number of limited time periods during the entire year. In this sense, the following analysis is somewhat restricted, but the use of census data offers no other choice.

The data in Tables III-5 and III-6 show that for the total labor force, more persons worked during the entire year (50-52 weeks) in 1969 than in 1959. But as was the case with hours, males are much more likely to work 50-52 weeks per year than are females. In 1969, three-fourths of all males were continuously employed throughout the year as compared to only slightly one-half (54.4 percent)

of all females. Moreover, among females not working the entire year, the majority works under 40 weeks, whereas among males with less than 50-52 weeks, most work 40-49 hours.

Some of the inter-industry differences in the stability of employment are noteworthy (although the data for males show a remarkable similarity among industries). Tables III-5 and III-6 reveal, for example, that agriculture, in contrast to its high proportion of part-time employment, has a high share of employment working throughout the entire year. For both males and females, education, domestic service, eating and drinking places, and entertainment are characterized by a substantially lower proportion of employment with 50-52 weeks. We already have alluded to domestic service and eating and drinking places. The erratic nature of entertainment employment is obvious and the summer vacation schedules and substitute teachers in education account for the situation in that industry.

For Personal services, the high share of intermittent employment is due more to persons having either one job for a relative short time period or having several jobs during the year with significant amounts of unemployment between these jobs. It is interesting to note in this context that in all but one Personal service, relative more males worked less than 40 weeks in 1969 than they worked 40-49 weeks. The high prevalence of intermittent employment in Personal services is not very surprising, since these services include mostly low-skilled and low-wage occupations. Most positions in Personal services do not lead to a career, nor do they offer job security through seniority. Thus, many of the positions in Personal services are temporary and, moreover, they do not offer many incentives for the job holders to stay in them.

Finally, construction perhaps fits the example of a seasonal industry best, but it applies only to males, for female employment in construction usually is concentrated in clerical occupations, which are not exposed to the same conditions as on-site construction work. But the figures in Table III-5 show that construction increasingly becomes continuous employment. Similarly, in 1959, only one-half of employment in agriculture was at work for 50-52 weeks, but in 1969 this proportion had increased to 62.2 percent. As Morse (1969: 82) described this change:

> To the extent that in the past a large part of construction activity had to take place at the site itself and could not be carried on in unseasonable weather, the construction industry was also in the grip of the seasons. One of the major shifts in this industry has taken the form of the development of techniques which make it possible to employ a good part of the labor inputs which ultimately will go into the finished structure in offsite locations protected against inclement weather.

Thus, with more implementation of new technologies, construction work will more resemble work in other industries in terms of its work schedule throughout the year, although it is not likely to completely overcome the vagaries of weather and scheduling.

This part of the chapter has examined the nature of work scheduling in terms of two dimensions: full time vs. part time and continuous vs. intermittent employment. The first dimension was discussed by focusing on the number of hours worked per week, whereas the other dimension concerns the scheduling of work during the year in terms of weeks. Although some industries, such as domestic service, are characterized by equally high proportions of part time and intermittent work, this is not the case for many industries. Therefore, the two dimensions should be treated as analytically distinct ones, since the requirements for the scheduling of work during the day are not necessarily the same as those for the entire year.

Employment and the Input of Labor

The discussion in Chapter II demonstrated how the various service industries, in particular Social and Producer services, steadily increased their share of the total labor force during the past one hundred years. We noted before, however, that the sectoral transformation of the labor force towards service industries does not necessarily imply an equal shift of labor input towards services. If workers in services work substantially shorter hours and weeks than in goods-producing industries, for example, the distribution of total labor input among industries would be quite different from that of employment. Although the shifts of employment in themselves are significant, the growth of services becomes even more important if it includes actual labor as well. The following section thus examines the relationship between employment and labor input.

To address this relationship, data for the total number of hours per year were computed for each of the 37 industries. This was done by multiplying the number of hours per week with the number of weeks worked per year for each employed person in a given industry. (Since we are not dealing here with the scheduling of work, but rather with the total input of labor, the two dimensions can be linked in this case.)

Two methodological shortcomings must be mentioned, however. One concerns the assumption that the number of hours worked in a given week is the same for all weeks worked. This is not very likely to be the case, although it should hold better for industries in which the employment is fairly regulated. The other handicap is that the data for weeks are given for the years preceding the 1960 and 1970 censuses, 1959 and 1969 respectively. Thus, the number of weeks reported for 1969, for example, could have been for an industry other than the one reported in 1970. This is an inherent problem quite common with census data, and it will be encountered again in the discussion of earnings. It is not believed, however, that the two assumptions made here will involve a systematic bias, and the data therefore should be considered as fair approximations of the actual situation.

In Table III-7 we present the number of yearly hours per worker in 1969 for each of the 37 industries. These data show that on the average a person in the Extractive sector works the most hours, whereas the Personal service sector accounts for the smallest number of hours per worker. Workers in the Transformative sector are employed for the second largest number of yearly hours, followed by Distributive, Producer, and Social services.

TOTAL LABOR FORCE	2002		1581		1885	

But, again, the situation changes when we differentiate the labor force by sex. For the total labor force, the average woman works about three-fourths as many hours per year as the average man (1521 and 2002 hours per year, respectively). Another difference occurs in the relative positions of industry sectors between males and females. For males, the Extractive sector accounts for the highest number of yearly hours per worker, whereas females work the most hours in the Transformative sector. Both males and females work the second most hours in the Producer services sector, while Personal service account for the least number of hours per worker.

It can be noted from the data in Table III-7 that the differences between sectors are much smaller among males and among females than for the total labor force. For example, there is a difference of 447 yearly hours per worker between the highest and the lowest sectors, Extractive and Personal services, respectively. In contrast, the difference between the two extremes is only 322 hours for males and 353 hours for females. This situation is the result of the different industry structure of male and female employment and the fact that females work fewer hours than males. Since women are more concentrated in Producer, Social, and Personal services, their fewer yearly hours mean that the average number of yearly hours per worker is lower in these three sectors when compared to the others.

Although this discussion implies that the growth of service employment has been faster than the growth of service labor input, the difference does not appear to be very large. To assess the magnitude of this difference more exactly, the percentages of the total number of hours worked during 1969 were computed for the six industry sectors and for each of the 37 industries. These data (Table III-8) reveal that among industries the difference between the percent of total employment and the percent of total labor is minimal indeed. For the total labor force, Social and Personal services account for smaller proportions of total employment than of total labor, while the share of total labor exceeds that of total employment the most in the Transformative sector. A very similar situation exists for males and for females, although the differences between employment and labor among industries are more pronounced for females.

The most striking difference between males and females in terms of employment and labor involves the Transformative sector. For males, this sector accounts for a higher share of total employment than of total labor, whereas this difference is reversed for females. The proportion of total labor in the Transformative sector exceeds that of total female employment in this sector by two to six percentage points. This finding is significant for it suggests that the relatively higher proportion of part-time and intermittent work of females as compared with males is mostly concentrated in Social and Personal services. This result thus serves as further support of the assertion made earlier in this chapter that the process of production in Transformative industries is not very conducive to part-time and intermittent work.

The data for the 37 industries by and large show the same pattern as the sectors. Two industries stick out, however: education and domestic service. In both of these industries the share of total employment much exceeds the share of total labor. These two industries therefore are mainly responsible for the fact that the Social and Personal service sectors account for relatively more

TOTAL LABOR FORCE	100.0	99.9		100.0	99.7		100.0	99.8	

employment than labor. Aside from these two industries, however, the differences between employment and labor are negligible. In sum, the results demonstrate that the sectoral transformation of the labor force moving towards a concentration of employment in service industries has been accompanied by an equally impressive concentration of labor input in services.

PART II: INTER-INDUSTRY MOVEMENT OF EMPLOYMENT

Up to this point the analysis has been concerned with the changes in the industry structure of employment between 1960 and 1970. We have been able to show in Chapter II that the labor force in the United States increasingly has become concentrated in service industries. Not all service industries have expanded, however, and it is the growth of Social and Producer services in particular that is noteworthy. But the analysis did not show how this shift of employment--i.e., the sectoral transformation of the labor force--has occurred. Was the expansion of services due mostly to people moving from Extractive and Transformative industries into the various service industries, or did services grow largely because of new labor force entries? This is an important consideration, for it can shed light on the transferability of employment from one industry to another. If the employment in a given industry decreases, for example, what possibilities exist for people employed in that industry to move elsewhere? And where do they move? It is this set of questions that can now be addressed. (It must be kept in mind that this section does not deal with the reasons for the sectoral transformation of the labor force, but rather with the mechanism by which it occurs.)

Before entering the analysis, however, a few limitations must be discussed. Since this study concentrates on the sectoral transformation of the labor force between 1960 and 1970, the changes of employment from one industry to another should be examined for the same period. Unfortunately, the census questionnaire only permits an analysis for the 1965-70 period. As we noted in the preceding chapter, the 1960's were not an unusual decade in the sense that its labor force changes are the result of conditions and events specific to that period. The same is true of the 1965-70 period. We therefore believe that the inter-industry shifts of employment between 1965 and 1970 are representative of any five-year period during the past twenty years.

In the 1970 Census, a question was asked concerning the industry a person worked in back in 1965. It is the information from this question which forms the basis for the present analysis. It is important to note that the question concerning the 1965 industry was asked of all persons in the particular sample of the census, regardless of their work status in 1970. The sample thus includes people who were not in the labor force in 1970 but who did work in 1965, as well as those who were not in the labor force in 1965 but who were employed in 1970.

The second major limitation of this part of the analysis concerns the fact that we are dealing here exclusively with industries. In order to assess the meaning of the transfer of employment from one industry to the next, however, we would also want to know the kind of work--occupational structure--within a given industry. It is quite clear that different occupations have different degrees of transferability. Lawyers, for example, can be employed in a large

variety of different industries, whereas certain specialists, e.g., an aerospace engineer, cannot readily transfer their skills to other industries. On the other hand, this analysis of inter-industry shifts of employment is, to our knowledge, the first attempt to understand on the national level the changes of the labor force from one industry to another. It therefore must be regarded as largely preliminary; once we know more about how industries are related to each other in terms of exchange of employment, additional variables that are important, such as occupation and class of worker, need to be introduced.

Of particular interest is the examination of the three industry sectors whose share of employment decreased between 1960 and 1970: Extractive, Transformative, and Personal services. Three possibilities can be identified to account for the proportionate decline of employment in these sectors: (1) a shift of employment to the other industry sectors; (2) the exit of persons employed in these sectors from the labor force as such; and (3) a disproportionately small number of new labor force entries employed in the three sectors, such as to reduce the proportionate share.

To analyze these different possibilities, it should be noted at the outset that different population groups vary substantially in their labor force behavior. The most important difference in this respect is that between males and females, both in terms of their distributions among industries, and their patterns of labor force entry and exit. For these reasons, separate analyses will be carried out for males and females. Moreover, inter-industry movements of employment are likely to differ by age. A large proportion of persons over sixty years of age can be expected to leave the labor force, whereas this is less likely for persons under 30. Middle age workers should be expected to exhibit the highest propensity to remain in a given sector, as persons usually reach the zenith of their work careers between the ages of 35 to 45. Since the age structure of employment differs from one industry to another, the analysis in this section will be controlled for age, using the following age categories: under 30 years of age, 30 to 45, and over 45.

Because of the differentiation by sex and age, the sample size does not permit an examination of detailed industries. Many industries have a relatively small employment size to begin with, and once separate age groups, differentiated by sex, are distinguished, the frequencies become too small to permit a meaningful analysis. This problem is made more severe because we have to rely on the 1/1000 sample for this part of the analysis, in contrast to the use of the 1/100 sample tapes for the rest of the study. But even with the larger sample, it is doubtful that the analysis of inter-industry shifts of employment could have been carried out on the level of the 37 detailed industries. Therefore, the results will be presented for the six industry sectors.

Male labor force. The data in Table III-9 show that 60 to 80 percent of employment in a given sector in 1965 remained in that sector in 1970. Of the three sectors whose share of employment declined from 1960 to 1970, Extractive and Personal services show the least continuity of employment during the 1965-70 period. On the other hand, Social services and Transformative are characterized by the highest degree of employment stability: in the Social services four of

Table III - 9

PERCENT OF MALES EMPLOYED IN 1965 WHO REMAINED IN THE SAME INDUSTRY SECTOR IN 1970, BY AGE CATEGORIES OF 1970

Industry Sector	Under 30	30-45	Over 45	Total
Extractive	46.0	70.8	65.4	64.0
Transformative	68.2	83.8	75.9	76.2
Distributive Services	51.2	79.1	75.2	71.1
Producer Services	60.4	77.3	75.8	72.9
Social Services	52.8	85.2	80.0	79.2
Personal Services	36.2	67.6	66.7	60.4

every five males employed remained in that sector, as did three of every four males in the Transformative sector.

When a control is provided for age, however, the situation changes somewhat. Among males under 30 years of age, the Transformative sector reveals much the highest degree of continuity in its employment over the 1965-70 period. This shows that, regardless of age, once males enter the Transformative sector they are unlikely to leave it (at least in this five-year period). On the other hand, only slightly more than one-half of males under 30 years of age who worked in Social services in 1965 remained there until 1970. This proportion is substantially smaller than the degree of continuity for total male employment in the Social services sector. This is due largely to the low degree of continuity of employment in hospitals, welfare and religious services, and miscellaneous professional services. As males in medical services and education are much more likely to remain in a Social service industry, it is likely that these males who are leaving the Social services sector have occupations other than professional ones, since both education and medical services employ a large number of professionals. Any definite statements about this relationship, however, must await the inclusion of occupational data in a later analysis.

The low degree of employment continuity in the Extractive and Personal services sectors that was noted for total employment in these two sectors also exists for all three age groups when compared to the remaining industry sectors.

Regardless of the industry sector, the following pattern of stability of employment by age emerges: males between 30 and 45 years of age are the most stable, ranging from a low of 67.6 to a high of 85.2 percent. This finding thus is consistent with the expectation that males in the mid-range of their careers are most likely to remain in the same type of work. The second most stable figures are accounted for by males over 45 years. Males under 30 years were least likely to have continued in the same industry sector in 1970 in which they had been employed in 1965, but the range for this age category is quite broad, from a low of 36.2 percent in Personal services to a high of 68.2 percent in Transformative.

The foregoing discussion demonstrates that at least 60 percent of total employment in a given industry sector can be expected to remain there over a five-year period, although this proportion differs significantly by age group. On the other hand, a sizeable proportion of employment does leave each particular industry sector within that same relatively short time period. Where do these people go? To answer that question, we shall divide the group of males leaving their respective industry sector into two sub-groups: (1) those moving to a different industry sector, and (2) those leaving the labor force entirely. Since the age groups of 45 years and over includes many males near retirement age, this age group must be expected to have a larger proportion of people leaving the labor force than entering a different industry sector. Among the age groups of less than 30 years, most males leaving their industry sector can be expected to move to another sector. With respect to the age group in the middle, the proportion of persons moving to a different sector also should be higher than that leaving the labor force, but the difference should be smaller in comparison to the youngest age group.

The data in Table III-10 basically support these expectations. In all industry sectors, a larger proportion of males over 45 years left the labor force

Table III - 10

PERCENT OF MALES EMPLOYED IN 1965 WHO CHANGED SECTORS OR LEFT THE LABOR FORCE BETWEEN 1965 AND 1970, BY AGE CATEGORIES OF 1970

1965 Industry Sector	Changing Sectors 1965-1970			Leaving Labor Force 1965-1970		
	Under 30	30-45	Over 45	Under 30	30-45	Over 45
Extractive	35.8	23.3	13.0	18.2	5.9	21.9
Transformative	20.4	12.1	7.1	11.4	4.1	17.1
Distributive Services	33.5	17.1	9.2	15.3	3.8	15.6
Producer Services	32.2	20.1	11.0	7.3	2.6	12.8
Social Services	33.8	11.8	7.0	13.4	3.0	13.0
Personal Services	44.4	25.3	15.5	19.3	7.1	17.8

than moved to a different sector. For the other two age groups the reverse pattern held, as was expected. Some features of Table III-10, however, deserve special attention. For one thing, the proportions of males leaving the labor force do not differ all that much between the youngest and the oldest age groups, although it could have been expected that the older age group would have much higher labor force exits. Indeed, younger males left the labor force from Social and Personal services in larger numbers than older males. The only sectors where older males left the labor force in appreciably larger proportions than younger males are the Extractive, Transformative, and Producer services sectors.

Although the available census data do not offer much help in explaining this situation, one might want to speculate about possible reasons for the high proportion of young males leaving the labor force. Perhaps the most important reason is their decision to go back to school. Particularly in the case of industries in which the job structure does not offer many career possibilities, such as in retailing or in eating and drinking places, young males could be expected to obtain additional education in order to find better positions. Military services is another reason, since members of the armed forces are excluded from our sample.

Concerning the oldest age category, 45 and over, it does not appear that the reason for their leaving is not due to age alone. The two industry sectors with the highest proportion of males over 45 who left the labor force, the Extractive and Personal services sectors, also have the highest proportions of males over 65 that continue to be employed (see U.S. Bureau of the Census, 1973:Table 237). Similarly, we did not find that self-employment is related to the proportion of older males leaving the labor force. Other variables that might be considered in this context include unionization, new technologies, and the demand for labor in certain industries. Whatever the reasons may be, it is important to note that the proportion of males under 30 years of age who left the labor force between 1955 and 1970 comes close to that of the oldest age group and is up to four times the figure for males aged 30-45 who left the labor force during that same time period.

The data in Table III-10 show further that in all six industry sectors males under 30 years of age have the highest proportions of inter-sector changes, followed by males aged 30-45. By the time a male worker reaches the age of 45 and over, he is more likely to leave the labor force entirely rather than move to a different sector.

One of the most interesting findings is the extremely high proportion of males under the age of 30 who left the Personal services sector: more males left than remained in these industries. This indicates that Personal services are viewed by many young males as only a temporary work setting. Although the share of inter-sector shifts of employment for the Personal services sector is lower in the other two age groups, this sector nevertheless accounts for the highest proportions relative to the other industry sectors in all three age groups. The second largest shares are accounted for by the Extractive sector. It thus can be seen that the two sectors which were identified in Table III-9 as having the lowest proportions of employment remaining in the same sector also account for the highest proportions of employment moving to a different sector as well as leaving the labor force entirely.

The final question to be addressed in this part is, Where did the men go who changed industry sectors between 1965 and 1970? The answer is given in Table III-11. Of all sectors, Transformative industries received the majority of employment that came from other industry sectors. This pattern is particularly strong for males under 30 years of age, but it is also prevalent among males aged 30-45. Among the oldest of the three age groups, however, some other sectors received larger shares of employment than the Transformative sector. Six percent of total employment in Personal services in 1965, for example, went to the Distributive sector by 1970, compared to only 3.4 percent for the Transformative sector.

The second largest proportions of employment leaving other industry sectors are accounted for by the Distributive services sector. The flow of employment to the remaining sectors is relatively small, with only few exceptions. It is particularly noteworthy that very few males moved into either the Extractive or the Personal services sector. Obviously, these sectors are not very attractive to persons already employed and therefore depend for their employment almost exclusively on new labor force entries.

In Table III-12 the total share of employment that left each industry sector is proportionately divided among the receiving sectors. For example, 57.7 percent of all males who left the Extractive sector between 1965 and 1970 went to the Transformative sector. These data show that for all three age groups males who left the Extractive and Distributive services sectors were much more likely to go into Transformative industries than were males from the remaining service sectors. Moreover, males who left the Transformative sector entered Distributive services to a greater extent than males from other industry sectors (except in the case of the oldest age group in which the share was the second largest).

The data in Tables III-11 and III-12 do not suggest that the sectoral transformation of the labor force has been the result of persons having left other industry sectors for employment in Social and Producer services. It seems likely, therefore, that the growth of employment in these two industry sectors is mainly due to persons not previously in the labor force who enter these particular services in disproportionately large numbers.

Female labor force. Women in the labor force are much less likely to continue work in the same industry sector over a five-year period than are men (see Table III-13). The proportion of total female employment remaining in the same industry sector from 1965 to 1970 ranges from about two-fifths to two-thirds, compared with a range of about three-fifths to four-fifths for males. Despite the fact that women have lower levels of employment continuity in all industry sectors, the differences among the sectors in terms of employment continuity are very similar for males and females. As in the case of males, for example, females are most likely to continue work in the same industry sector in the Social services and Transformative sectors, with the Extractive and Personal services sectors being characterized by the lowest degree of employment stability. Among the six industry sectors, continuity of female employment appears to be positively associated with the 1960-1970 increase in employment as a proportion of the total female labor force.

VI.	Personal services	5.2	21.9	38.7	11.0	23.2	--	100.0

Table III - 13

PERCENT OF FEMALES EMPLOYED IN 1965 REMAINING IN THE SAME INDUSTRY SECTOR IN 1970, BY AGE CATEGORIES OF 1970

Industry Sector	Under 30	30-45	Over 45	Total
Extractive	32.1	51.6	42.3	42.4
Transformative	43.2	64.0	69.9	66.1
Distributive Services	29.5	60.2	64.3	55.5
Producer Services	36.1	56.8	64.7	53.9
Social Services	47.1	71.4	72.6	67.6
Personal Services	29.8	54.8	58.9	52.3

The Extractive and Personal services sectors have the lowest degree of continuity of employment and they also experienced a decline in their proportion of total employment during the 1960-70 period. In the same vein, the two industry sectors with the largest increase in proportional employment between 1960 and 1970, Social and Producer services, also account for higher degrees of employment stability. The only exception to this relationship is the Transformative sector which had the second highest proportion of females continuing work in that sector, yet it lost 2.6 percentage points of its share of total female employment between 1960 and 1970.

The relative position of industry sectors in regard to employment stability does not change much when age is introduced as a control variable. Again, this finding is consistent with the situation of male employment. Social services and Transformative sectors, for example, are characterized by the highest shares of female employment continuing in the same sector in all three age groups. The only significant difference is the extremely low proportion of females under 30 years of age that remained in the Distributive sector between 1965 and 1970, as compared with the proportion of female employment in the other two age groups that continued work in Distributive services. Within the youngest age group, however, Distributive services are not that much different from Personal services and Extractive in regard to employment continuity: in all three sectors, less than one-third of female employment continued in its respective sector during 1965-70.

In contrast to males, however, who maintained the highest levels of employment stability in the age group 30-45 years, females are the more likely to continue in the same industry sector in the oldest age group (over 45 years). The only exception to this pattern is the Extractive sector.

Given the low proportion of females that remained in their respective industry sector between 1965-70, it is even more mandatory than in the case of males to ask: Where did those women go? Do women move to other industry sectors in greater proportions than men, or are they more likely to leave the labor force as such? Based on the findings from previous studies about female labor force participation (e.g., Bowen and Finegan, 1969; Oppenheimer, 1972; Youssef, 1974), it is expected that women will leave the labor force in larger numbers than males. This should hold for all age groups, although for different reasons. The youngest age group (under 30 years of age) includes the ages when women have the majority of their children. It therefore should be expected that this age group has the highest proportions of women leaving the labor force.

In a recent article Valerie Oppenheimer examined the "interaction of men's occupational and family life cycles" (1974). Her conclusions included the statement that "For many American families...increases in the husband's earnings over time that are typically associated with changes in his occupational life-cycle stage do not really seem to parallel increases in the cost of living associated with a more advanced stage of the family life cycle" (Oppenheimer, 1974:244). It is during the time when the wife is between 30-35 and 45-50 that the needs of additional income are the highest. Assuming a close relationship of the female labor force participation and the life cycle of the family (which has been demonstrated

in different contexts by Cain, 1966, and Sweet, 1973, among others), we can expect that women between the ages of 30 and 45 enter the labor force in relatively large numbers to provide the needed supplement to family income. Once this life-cycle squeeze is over, however, a large proportion of married women can be expected to leave the labor force again. For this reason, the proportion of women aged 30-45 that leave the labor force is expected to be very similar to that for women over 45 years of age.

An inspection of Table III-14 confirms these expectations. In all industry sectors for all three age groups females leave the labor force in much higher proportions than do males. Moreover, women under 30 years of age have the highest proportions of labor force exits. Finally, not much difference exists between the other two age groups, as was expected. In general, about one-fourth of those employed in a given industry sector in 1965 had left the labor force by 1970. This pattern is quite different from that observed for males who are very unlikely to leave the labor force during the ages of 30 to 45 years.

The other important difference between male and female employment is the fact that in all six industry sectors, regardless of age, the number of females changing industry sectors is much smaller than the number of females leaving the labor force. For males this pattern exists only for the age group over 45. Moreover, females also are less likely than males to change industry sectors. This finding is somewhat surprising, for very large proportions of females are to be found in clerical, service, and operative occupations. Many of these occupations, such as secretaries, involve skills that would seem to be easily transferable so it could have been expected that women would change industry sectors in <u>larger</u> proportions than males. In sum, the data in Table III-14 suggest that the smaller proportion of females remaining in the same industry sector is primarily the result of women leaving the labor force.

The final question to be addressed in this chapter is, Where do those women go who leave a given industry sector and remain in the labor force? In contrast to the male labor force, which is most likely to change to Transformative industries, Social services absorb the largest proportions of females changing industry sectors. Table III-15 shows further that hardly any women move into Extractive industries, the highest proportion being 0.3 percent of employment in any given industry sector.

In order to compare the relative proportions of inter-sector shifts of employment among industry sectors, Table III-16 shows the percentage distribution of all females in a given sector who had left that particular sector by 1970. Besides demonstrating even more clearly that Social services absorb the largest proportions of inter-industry shifts of employment, these data reveal some additional features. Consistent with the male pattern, females over 45 years of age are less likely to enter Transformative industries than younger females. But most interesting is the finding that women who left the Extractive sector are more likely to enter Transformative industries than Social services. This pattern is particularly striking for the age group 30-45 years, for which only 8.6 percent of all women who left the Extractive sector between 1965 and 1970 for another industry sector went to Social services by 1970. Furthermore, a disproportionately large number

VI. Personal Services	1.9	18.7	25.2	10.3	43.9	--	100.0

of females who had been in the Extractive sector moved into Personal services. Although at this point female employment in Extractive industries does not account for a sizeable proportion of total female employment, one could ask if this same pattern existed when women were more numerous in Extractive industries.

The foregoing analysis of inter-industry shifts of employment suggests, for males as well as females, that the sectoral transformation of the labor force towards Producer and Social services has not been mainly brought about by persons moving into these two sectors from other industries. It is true that females did move to Social services in larger numbers than to any other industry sector, but it also must be kept in mind that for females Social services are the most important source of employment. It therefore is expected that this sector receives the largest proportions of total inter-sector shifts.

How then did the growth of employment in services come about? The way by which the sectoral transformation of the labor force takes place is a complex process. Various movements occur simultaneously, some of which have been already discussed. Drawing in part upon the earlier discussion, we now can fully identify the various mechanisms of the sectoral transformation of the labor force. Changes in the number of persons employed in sector X during the time period T_0 - T_1 can be separated into the following components:

(1) the number of persons employed in sector X in T_0 who remained in sector X by T_1;

(2) the number of persons employed in sector X in T_0 who moved to a different sector by T_1;

(3) the number of persons employed in sector X in T_0 who left the labor force by T_1;

(4) the number of persons employed in different sectors in T_0 who entered sector X by T_1;

(5) the number of persons not in the labor force in T_0 who were employed in sector X by T_1.

This procedure demonstrates that we must examine the 1965 and 1970 labor force simultaneously to show how inter-industry shifts and the sectoral transformation of the labor force are related.

The main shortcoming of this approach is the fact that it is restricted to two points in time. It would be preferable, to be sure, to have annual data, since in a given time period changes take place that are reflected neither in the data at the beginning of the time interval, nor in the data at the end of the interval. For example, it is possible that a person who was employed in the Social services sector in 1965 and 1970 worked in the Transformative sector from 1966 to 1969. This problem, however, is a general one whenever census data are used. Richard Stone (1975: 253-300), for instance, noted that in dealing with the changes of a population

during a specific time interval census data yield no information about persons who are born after the initial date but who die before the closing of the interval, or about persons who enter and leave the country during this time period. On the other hand, the great amount of information contained in census data, and its large sample size, as in the case of the Public Use Sample tapes, have advantages that most surveys do not offer.

The identification of the different components by which an industry sector changes its employment during a given time period permits us to examine the extent to which inter-sector shifts of employment contributed to the changes in the distribution of the labor force by industry sectors. For each sector we know the number of persons employed in 1965 and 1970. The difference between the two numbers is the result of: (a) persons moving from one industry sector to another; and (b) persons entering and leaving the labor force. For example, some persons who were employed in a certain industry sector in 1965 leave this sector by 1970. During the same time this sector receives persons by 1970 who had been employed elsewhere in 1965. The same situation exists for labor force entries and exits. Some persons who were employed in an industry sector in 1965 left the labor force by 1970, while the total employment in that sector in 1970 includes persons who were not in the labor force in 1965. For these reasons, it is net entries and the net sector shifts of employment which produce changes in the number of persons employed in an industry sector during a given time. Thus,

$$N_{i1970} - N_{i1965} = (LE_{i1970} - LEX_{i1965}) + (SE_{i1970} - SEX_{i1965})$$

where: N_i is the number of persons in the ith sector,

LE_{1970} is the number of persons in the ith sector in 1970 who who were not in the labor force in 1965,

LEX_{1965} is the number of persons in the ith sector in 1965 who left the labor force by 1970,

SE_{1970} is the number of persons in the ith sector who had been in a different sector in 1965, and

SEX_{1965} is the number of persons in the ith sector in 1965 who went to another sector by 1970.

These data were computed for all industry sectors and the net entries and net sector shifts are presented in Table III-17 for males and Table III-18 for females. Negative net entries refer to the situation in which a sector experienced more labor force exits than entries during the 1965-70 period. Negative net sector shifts occur when the number of persons leaving one sector for another is larger than the number of persons entering that sector from a different sector during 1965-70.

Male employment in the Extractive sector (Table III-17) will serve as an explanation of the nature of these tables. The Extractive sector experienced a decline in absolute numbers of employed males between 1965 and 1970, the difference

Table III-17

COMPONENTS OF EMPLOYMENT GROWTH IN INDUSTRY SECTORS,
MALE LABOR FORCE, 1965-1970

Industry Sector	1965 Labor Force (1)	1970 Labor Force (2)	Difference (3)=(2)-(1)	Net Entry (4)	Net Sector Shift (5)	Difference (6) = (3)	Net Entry (7)=(4)/(3)	Net Sector Shift (8)=(5)/(3)

NOTE: Figures based on 1/1000 Public Use Sample

being - 347 (Column 3). (Note that these numbers are drawn from the 1/1000 rather than the 1/100 Public Use Sample.) Labor force exits from the Extractive sector during 1960-70 were larger than labor force entries by 31 (Column 4) and the total amount of males leaving the Extractive sector during 1965-70 for another sector exceeded the number of males entering the Extractive sector from other industries by 316 (Column 5). Columns 7 and 8 respectively, refer to the proportion that net entries and net sector shifts account of the difference in employment between 1965 and 1970 (Column 3) for each sector.

The data in Tables III-17 and III-18 show that net sector shifts account for around 90 percent of the total decline of males and females in the Extractive sector. This sector lost more employment to other sectors than it received during 1965-70. Also, fewer workers entered Extractive industries than left in that period, contributing further to the decline of employment in that sector.

Aside from the Extractive sector, however, net entries accounted for larger proportions of the employment differences as compared to net sector shifts in all other industry sectors. The patterns are quite similar for males and females, but the magnitudes of the proportions vary somewhat. It is noteworthy that for males all industry sectors but the Producer and Social services have negative net sector shifts of employment. Thus, these two service sectors were the sole beneficiaries of the inter-sector shifts of employment. But even for these sectors, net entries account for a larger share of the increase in employment between 1965 and 1970 than net sector shifts.

For females the importance of net entries for the growth of employment in Producer and Social service is even more pronounced. As in the case of males, female labor force entries by far outnumber exits in Distributive and Personal services. These two sectors, however, increased their employment less than could have been expected from the net entries, since they lost many more females to other sectors than they received. The only sector besides Producer and Social services with a positive net sector shift were Transformative industries.

While the data presented in Tables III-17 and III-18 explain the growth of the industry sectors in absolute numbers, they do not yet permit us to evaluate the relative importance of net entries and net sector shifts as sources for the sectoral transformation of the labor force. Since the total labor force expanded between 1965 and 1970, it can be expected that each sector increased in numbers as well. As a result, net entries are more important than net sector shifts for the absolute growth of employment in industry sectors.

But the sectoral transformation of the labor force is due to the fact that in some sectors employment will increase at a faster rate than the total labor force, whereas it will increase more slowly or even may decline in other sectors. For this reason, the growth of employment in each industry sector must be related to the growth of total employment. Thus, in order to assess the importance of net entries in each sector independent of the growth of total employment, we must assume that each sector increases in numbers at the same rate as the labor force. This is done by multiplying the number of persons employed in each sector in 1965 (see

Tables III-17 and III-18) by the growth factors of the male and female labor forces, respectively. The difference between the expected number of persons employed in a given sector in 1970 and the number of persons employed in that sector in 1965 is the expected growth. We then computed the difference between the actual growth and the expected growth of employment in each sector, which we call net shift. Positive net shifts indicate that the employment in that sector increased faster than expected, while negative net shifts indicate a slower growth than expected.

Since we assume that employment in each sector shows the same rate of growth as the labor force, the expected growth in each sector is due entirely to net entries. For this reason, the expected growth is subtracted from the net entries (given in Column 4 in Tables III-17 and III-18), and this difference is called net entry shifts. Positive net entry shifts indicate that the actual net entries exceed the expected net entries, and negative net entry shifts are obtained when the number of expected net entries is larger than the number of actual net entries.

The procedure outlined above permits us to evaluate the relative importance of net entry shifts and net sector shifts for the sectoral transformation of the labor force. The results are presented in Table III-19 and III-20.

The case of males in Social services will serve as an example for the interpretation of the tables. Table III-19 shows that the actual growth of males in Social services exceeded the expected growth by 812 (Column 3). Column 4 indicates that the actual number of net entries in Social services were larger than the expected net entries by 447; the net entry shift therefore accounts for 55 percent (Column 7) of the net shift in Social services. Similarly, Social services received 365 more males from other sectors than it lost to those sectors between 1965 and 1970 (Column 5); the net sector shift thus is responsible for 45 percent of the net shift (Column 8).

The results show for males that the net entry shifts were more important for the proportionate changes of employment than the net sector shifts in all industry sectors except Producer services, but this difference was only moderate in the Extractive and Social services sectors. Of particular interest is the case of Personal services. This sector received many more net entries than expected, but due to the large negative net sector shift, the proportionate growth of employment in Personal services was only slight.

The patterns for females resemble the situation for males in the Extractive and Social services sectors. For example, the proportionate growth of the employment of females in Social services was mainly due to the fact that the net entries of females into this sector were larger than expected; net entry shifts therefore explain about two-thirds of the net shift of employment in Social services.

In the four remaining sectors, however, the relationship between net entry shifts and net sector shifts is different for females and males. The proportionate decline of female employment in the Transformative sector is due entirely to the deficit in net entry shifts. Indeed, had not more females entered Transformative industries from other sectors than left during the 1965-70 period, the proportionate decrease of the Transformative sector would have been even more severe.

Table III-19

COMPONENTS OF THE SECTORAL TRANSFORMATION OF THE MALE LABOR FORCE, 1965 - 1970

Industry Sector	Actual Growth (1)	Expected Growth (2)	Net Shift (3)=(1)-(2)	Net Entry Shift (4)	Net Sector Shift (5)	Net Shift (6)=(3)	Net Entry Shift (7)=(4)/(3)	Net Sector Shift (8)=(5)/(3)
Extractive	-347	334	-681	-365	-316	100.0	53.6	46.4
Transformative	848	1,748	-900	-853	-47	100.0	94.8	5.2
Distributive Services	1,316	916	400	416	-16	100.0	104.0	-4.0
Producer Services	579	270	309	123	186	100.0	39.8	60.2
Social Services	1,355	543	812	447	365	100.0	55.0	45.0
Personal Services	348	288	60	234	-174	100.0	390.0	-290.0

Growth Factor: $\frac{\text{1970 Male Labor Force}}{\text{1965 Male Labor Force}} = \frac{42,391}{38,292} = 1.1070458$

NOTE: These figures are based on the 1/1000 Public Use Sample, 1970.

Table III-20

COMPONENTS OF THE SECTORAL TRANSFORMATION OF THE FEMALE LABOR FORCE, 1965-1970

Industry Sector	Actual Growth (1)	Expected Growth (2)	Net Shift (3)=(1)-(2)	Net Entry Shift (4)	Net Sector Shift (5)	Net Shift (6)=(3)	Net Entry Shift (7)=(4)/(3)	Net Sector Shift (8)=(5)/(3)
Extractive	-65	87	-152	-94	-58	100.0	61.8	38.2
Transformative	734	1071	-337	-438	101	100.0	130.0	-30.0
Distributive Services	875	915	-40	81	-121	100.0	-202.5	302.5
Producer Services	438	447	-9	-29	20	100.0	322.2	-222.2
Social Services	2218	1386	832	545	287	100.0	65.5	34.5
Personal Services	479	776	-297	-68	-229	100.0	22.9	77.1

Growth Factor: $\frac{\text{1970 Female Labor Force}}{\text{1965 Female Labor Force}} = \frac{25,895}{21,216} = 1.2205411$

NOTE: The figures are based on the 1/1000 Public Use Sample, 1970.

Although both males and females had positive net entry shifts in the Distributive services sector, it was much smaller for females. On the other hand, females had larger negative net sector shifts than males; as a result, the proportionate employmont of females in Distributive services declined between 1965 and 1970, whereas it increased for males.

Finally, the data show that the net entries of females in Personal services were less than expected, while the reverse was true for males. Since the deficit of net sector shifts was even larger, the proportionate employment of females in Personal services declined.

We conclude from the results that net entry shifts are a more important source for the sectoral transformation of the labor force than net sector shifts, although the latter have a moderate impact on the proportionate changes of employment in most sectors.

Chapter IV

AGE AND SECTORAL TRANSFORMATION

Age seldom has been given the attention it deserves in social science research. All too often it is relegated to the status of a "control" variable, introduced into an analysis only so that the relationship between two other variables can be more clearly specified, as for example in the relationship between occupation and voting behavior. Lately, however, age is coming to be conceived of as worthy of consideration in its own right (see, for example, the three volume series on Aging and Society, especially Vol.3, A Sociology of Age Stratification, Riley, Johnson and Foner, 1972).

In the field of population age always has been a central variable, crucial for the very existence of the population model. As Ryder (1964: 449) aptly puts it:

> Age is the central variable in the demographic model. It identifies birth cohort membership ... It is a measure of the interval of time spent within the population, and thus of exposure to the risk of occurrence of the event of leaving the population, and more generally is a surrogate for the experience which causes changing probabilities of behavior of various kinds.

This project, and the census data on which it is based, does not permit a full elaboration of the potential of age as a variable, but it can contribute importantly to our knowledge of the structure and transformation of the labor force. The latter continually is being altered as a consequence of entries and exits of persons with different background characteristics who occupy different work positions. In addition, persons already in the labor force continually shift from one job to another. These myriad movements in the aggregate constitute the labor force transformation. As already has been seen in Chapter III, an important characreristic of this transformation is the age component.

In Table IV-1 the sectoral and industry distributions for the total labor force are presented by ten-year age intervals from 15-64. (This omits a few youngsters of 14 and a good deal more people 65 and over, but their absence does not significantly affect the discussion to follow.) The distributions are provided for 1960 and for 1970.

Let us first look at the pattern of distribution by age; since the relationships do not vary greatly from 1960 to 1970 we shall discuss only 1970. It is no surprise that the age category with the highest share of the total labor force in the Extractive sector is the oldest one, 55-64, for agriculture has been declining absolutely and relatively for several decades. The other five sectors all have their peak percentage in the younger age categories: Distributive and Personal services in the youngest category 15-24, and Transformative, Producer, and Social services in the 25-34 category.

Another way to examine the age distribution is to look at the direction of change in relative size from the youngest to the oldest age category. In

Table IV-1

PERCENTAGE DISTRIBUTION OF AGE GROUPS BY SECTOR AND INDUSTRY, TOTAL LABOR FORCE, 1960 AND 1970

37) Misc. personal serv.	.3	.2	.3	.2	.3	.2	.4	.3	.5	.4
TOTAL LABOR FORCE	100.0	100.0	100.0	100.0	100.0	100.1	100.0	100.0	100.1	100.0

Extractive it moves fairly regularly upward, from 3.7 to 6.8%, but for Transformative there is a jump from 27.5% to 34.6% in the 25-34 category, after which it declines to 32.4% in the oldest interval. The pattern for the Distributive sector is quite different, falling from 26.3% in the 15-24 category to 20.6% in the next oldest one, after which there is little change. This steep drop is due almost entirely to the influence of retail trade, which drops from 18.1% (nearly one-fifth of the entire labor force) to 10.3%.

The profile for Producer services shows a slight rise to 9.2% in the 25-34 category, followed by a modest decline to 7.1% in the oldest category. Social services has the flattest of all profiles, with two percentage points encompassing the range. Personal services begins high (13.3%), then drops sharply (to 7.6%) in the 25-34 category, after which it rises steadily.

In terms of the age distribution, the Distributive sector in particular, as well as Personal and Producer services, are likely to be entry sectors, while the other sectors have their strongest representation in the next older category, save for Extractive, which reflects its declining importance within the total labor force by its age distribution.

Tables IV-2 and IV-3 provide the same distributions for male and female, and we need not go over them in the detail that was given for the total population. The sex effect mainly is sharpened, especially for the males. For the latter, the Distributive declines much more, with retail having a remarkable drop from 20.5% in the 15-24 category to 10.3% in the 25-34 category, after which it levels off. Similarly, Personal services drop from 11.3% to 5.3% for the comparable age categories. The major difference between the sexes is in Producer services where the male gain over the age range is countered by a sizeable female decline, from 12.7% in 15-24 group steadily down to 7.4% in the 55-64 group. Personal services also differs, in that females have somewhat higher percentages in the oldest age category than the youngest one.

The intercensal changes are more pronounced by sex than for the total labor force. Many of the sectors and industries show relatively little change for the 1960-1970 period, but after all a decade is not very long a time for such changes to happen. Distributive services for males is exceptionally stable, and Transformative also is quite stable. The decline for males in Extractive between 1960 and 1970 occurs for virtually all age categories and the same is true for the increase in Social services. For females the decline in Transformative is important for the first three age groups but after that the last two show little change. The pronounced decline in Personal services is present for all age categories. Social services have the widest gains for females, present in all age categories.

There is another way to present the age distribution by sex: a graphic presentation by age-sex pyramids. In Appendix C each of the sectors and industries, used till now, are given for 1960 and 1970 for the five age categories 15-64, plus the 65 and over group. The presentation is in percentage rather than absolute terms, so the volume of each pyramid in 1960 equals that in 1970.

In glancing through these 88 age-sex pyramids, it is immediately apparent how much variation there is in the sector and industry distributions. The thin band representing females in the Extractive and Transformative sectors vividly

indicates the preponderance of males, excepting for textile, which is female dominated. Domestic service shows a reverse pattern, with males the slender band.

It is unnecessary to comment on each of the sectors and industries, for the graphic presentation is plain enough. Some general comments, however, are warranted:

1) In the youngest age category, 15-24, females often have a fairly broad base, thus resembling a general age-sex pyramid, but males frequently have a "notch" effect, due to the low representation in the youngest age group. This is understandable for industries such as engineering, legal and medical, which require a long training period, but it also is present in many Transformative industries.

2) Only a few of the pyramids display similar configurations on the male and female sides. In other words, in nearly all sectors and industries there is a clear difference in both the magnitude of sexual representation by age as well as the configurations the distributions assume. The sexual division of labor is manifest in most of the pyramids.

3) The 1960 and 1970 pyramids are, as could be expected, not strikingly different, especially since the percentage mode of presentation does not permit representation of changes in the size of the pyramids. For example, the 1970 agriculture pyramid would be only 60% the size of the 1960 one if the absolute figures were to be used. What is discernible in many of the pyramids is a tendency toward the flattening of the sides between 1960 and 1970, that is, for the proportion in the age groups to be somewhat more equal.

Let us now turn to a consideration of the growth of the population age groups between 1960 and 1970. More properly, we should speak of the change in the size of the five age groups, 15-64, during the decade, for we are not using a cohort approach; that is, taking the 15-24 age groups, for example, in 1960 and noting the "survivors" ten years later in the 25-34 age group. This approach is useful for the total population, but in the labor force, where many people, particularly females, enter, leave and re-enter a number of times, it is not warranted. Therefore, we will simply compare how many persons were in an age group in 1960 with the number in 1970 and compute the percentage change. To illustrate from Table IV-4, the sample size for the total 15-24 age group is 100,675 compared to 140,115 in 1970, a difference of 39,440 or a 39.2% increase. (These figures are from the 1% Public Use Sample and they differ from the published census reports not only because of sampling variation, but also because of other differences, i.e., the omission in our sample of persons allocated to industry and occupation in 1970. See Appendix A for a discussion of the 1960 and 1970 samples.)

There are striking differences in Table IV-4, differences that are due to a number of factors: size of the population in the initial period, changes in participation rates during the decade, etc. The range of the total population is from a 39.2% gain in the youngest age group to a decline of 4.6% in the 35-44 group. This decline is due wholly to the males, where there was a decline of nearly 10%. Outside of the 15-24 group, all the male age categories showed quite low increases or, in the one instance, of decrease. In contrast, the females, except for low growth in the 35-44 groups, have high percentage gains. They had

Table IV-4

PERCENT CHANGE IN AGE GROUPS IN LABOR FORCE, 1960-1970

Age Group	Total	Male	Female
15-24	39.2	26.5	58.4
25-34	10.6	2.8	30.1
35-44	-4.6	-9.7	6.0
45-54	11.3	5.3	23.0
55-64	16.6	8.0	35.5

twice the percentage increase of males in the youngest age group (a remarkable 58.4% increase!) and, in terms of relative gain, the difference between the sexes is even greater in three of the other four groups. Unquestionably, the major reason for these large differences is the substantial increase in female participation rates during the sixties, already mentioned in Chapter II. Since no prior decade had such a gain (8.9 percentage points, according to Table II-6) it seems unlikely that there will be any future decade that will witness as large a gain. To that extent, the 1960-1970 period is unusual.

In any event, the percent change in age groups is so different that this factor must be carefully taken into account when considering the relationship of age to sectoral transformation during the 1960-1970 period. Our attempt to do so is presented in the next section.

The Shift Approach as Applied to Age and Sectoral Transformation

The analyses of the age-sex distributions of sectors and industries for the 1960-1970 period have been useful, but admittedly they are limited in what they can tell us, particularly in addressing the question of change. At this point what is needed is a standard by which to evaluate the 1960-1970 change. The familiar practice of formulating an expected change and then comparing it with the actual change is our point of departure.

The standard proposed for the expected change is a simple one; namely, the growth rate of the total employed population for each of the five age categories (15-24, 25-34, 35-44, 45-54, 55-64). In other words, the basic assumption is that the five age categories for all sectors and all industries will grow at the same rates as the respective age categories for the total population. Against these expected changes can be placed the actual 1960-1970 growth. The difference between the two sets of figures will tell us the extent to which age categories for each sector and industry grew more or less rapidly than expected.

The statistical technique applied here is known as the "shift" technique. Huff (1967) has applied it to consumer market analysis, while Perloff, et al. (1960), Fuchs (1959) and Creamer (1943) have used it for industry location studies. The specific procedure can be explicated by reference to Table IV-5. (It is the same for Tables IV-6 and IV-7.) At the foot of the table are the values of the growth sectors (k) for the five age groups, each representing the intercensal change for the entire employed population. For example, for the 15-24 age group, the value is 1.391756, meaning that the number of persons aged 15-24 increased by 39% during the 1960-70 period. In contrast, the value for the 35-44 age group was .954030, a decrease of about 5% during the decade.

Examining the 15-24 age group for the Extractive sector, columns 1 and 2 give the numbers (the 1% sample figures) reported for 1960 and 1970. Column 3 is the actual 1960-1970 change while column 4, Expected Value 1970, is the product of the 1960 figures and the k value (8164 x 1.391756 = 11,362). Column 5 is the expected change 1960-1970 (11,362 - 8,164 = 3,198) had this age category changed exactly as did the total employed in the 15-24 age category. Column 6, the Net Shift, is simply the subtraction of the actual from the expected. In this case it totals -6,133 because of the negative sign for the actual change.

Table IV-5

NET SHIFTS OF AGE GROUPS OF THE TOTAL LABOR FORCE BY SECTOR AND INDUSTRY, 1960-1970

The last two columns of Table IV-5 are introduced as aids to interpretation. The Percentage Net Shift column indicates the relative importance of each of the age categories in each of the sectors and industries for the total population. Thus, continuing with the 15-24 Extractive sector age group, the -12.2 means that nearly one-eighth of all negative change by sectors is found in this one age category (6,133 ÷ 50,131 = 12.2). Since we are dealing with net shifts, the totals should add up to ± 100.0 (actually ±99.9 in this case because of rounding error.)

Whereas the net shift column reflects the importance of any one age category for the total employed labor force, the last column indicates the importance of the net shift for each age category in a given sector or industry. Thus, -75.1 means that the net shift (-6133) was three-quarters of the 1960 figure (8164). This is one of the largest differences in the entire table, but it is possible for the figure to be almost 0 (e.g., 0.5 for Transformative, 55-64). Columns 7 and 8 show great differences between them in magnitude because the bases of sectors and industries are so different.

Having explicated the procedures involved in the shift technique by reference to Table IV-5, let us state the case in general rather than specific terms. The shift analysis separates the actual change into two components: the expected change and the net shift. The expected change within sectors is the application of the growth rate of all persons in the age category to the actual 1960 sector and industry figures. This growth rate of the age category reflects many factors -- changes in the total population, changes in age and sex specific participation rates, changes in age of entry and of retirement. Now the assumption of the expected change is that all such factors affect the groups equally within each sector and each industry. Thus, the expected change component of the actual change may be viewed as divorced from changes caused by intersectoral movements of members continuing in the labor force, as well as the differential patterns of the incorporation of entry cohorts into specific industries and sectors. These latter types of changes are reflected in the net shift component.

There is another way of looking at this point. Since age groups are distributed unequally across sectors in 1960 and since they increased at different rates over the 1960-1970 decade, the expected sectoral distribution of the labor force could be expected to differ from the 1960 sectoral distribution. Conceivably, this expected difference would account for the movement out of the Extractive and Transformative sectors and the movement into the services. Thus, it is possible that the sectoral transformation could occur solely or predominantly as the result of expected changes, i.e, changes in the size of age groups.

This possibility is examined in Table IV-8. The actual 1960 and 1970 sectoral distributions of the five age groups are shown, along with the expected 1970 distribution based on the differential growth of age groups. It is clearly evident that the expected changes alone do not yield a "transformation" pattern. The expected sectoral redistribution is so slight as to be insignificant. And the pattern of these slight changes are not as would be anticipated. If the employed labor force would have changed as "expected" between 1960 and 1970, there would have been a movement into Extractive and out of Social services, the two sectors that actually experienced the largest loss and gain, respectively.

Table IV-8

ACTUAL VERSUS EXPECTED CHANGES IN THE SECTORAL DISTRIBUTION OF THE LABOR FORCE, AGES 15-64, FOR 1960 AND 1970

Industry Sector	Actual 1960 Distribution	Expected 1970 Distribution	Actual 1970 Distribution	% Point Difference 1970 Expected Minus 1960 Actual Dist.	% Point Difference 1970 Actual Minus 1960 Actual Dist.
Extractive	7.6	7.7	4.3	.1	-3.3
Transformative	36.2	35.9	33.7	- .3	-2.5
Distributive Svcs.	22.0	22.1	22.3	.1	.3
Producer Services	6.6	6.7	8.1	.1	1.5
Social Services	16.4	16.3	21.9	- .1	5.5
Personal Services	11.2	11.3	9.7	.1	-1.5
TOTALS	100.0	100.0	100.0		

Thus, it is evident that the much larger percentage point changes in the last column of Table IV-8 are due to sources other than changes in the size of age groups. In other words, it is due mainly to the new entry or re-entry patterns of members of the labor force and to the intersectoral shifts of existing labor force members as reflected by the net shift values.

The net shift figure reflects the portion of the actual change which was affected by "deviations" from the expected pattern of industry and sectoral participation. The deviations include the movements from one sector or industry to another by employed persons, or the entry or exit of greater or fewer number of persons than expected. Even more than the comparison of the situation in 1965 when compared to 1970 as provided in Chapter III, the shift approach is severely limited in what can be said about the origins of those entering or the destinations of those leaving particular sectors and industries. This is a familiar problem for those who must rely upon cross-sectional data. To make definitive statements about inter-industry mobility and its relation to age one needs longitudinal data such as that being accumulated in the Parnes study (1975).

What can we expect to get out of the shift share analysis? One lead is to link age structure to change of employment in a given industry. As we noted earlier in this report, the 1960's showed a slower growth of employment in the Transformative sector as compared with the total labor force. As a result, the share of total employment in this sector decreased from 35.9% in 1960 to 33.1% in 1970. The data in Table IV-5 show that four of the five age groups grew more slowly than could have been expected on the basis of the growth rates of these age groups in the total labor force. Only the oldest age group (55-64) expanded as expected.

The interesting finding of the differentiation by age is the fact that the youngest age group (15-24) showed the largest difference between actual and expected growth of employment. This suggests that with respect to the total labor force, relatively fewer new labor force entries find employment in the Transformative sector. (Whether this is by choice or not cannot be assessed with these data, but this point is not germane for our present purposes.)

The pattern demonstrated by the Transformative sector is, of course, constituted by the patterns of its eight industries. The one important exception to the sector pattern is machinery, which is also the single most important industry within the sector. This one industry accounts for 7.2 percent of the total positive net shift of the employed labor force and only the 35-44 age group expanded slightly less than expected.

The relationship for the proportionately decreasing industries to have less than expected growth in specific age categories holds in other sectors. It holds for agriculture and mining in Extractive, transportation in Distributive services, domestic service, repair, laundry and miscellaneous personal services in the Personal services sector. In each of these industries all age groups have negative net shifts. The consistency of patterns is not as strong for the proportionately increasing industries, where there are more cases of positive and negative net shifts within the same industries.

When one examines the age categories, the absolute numbers by category vary considerably. There is no regular progression, as would be the case in a

life table, where each successive age group is smaller than the previous one. Nearly always (Personal Services being an exception), the 15-24 category is smaller than the 25-34 category, because many persons of this age have not entered the labor force, as is graphically indicated by the "notch" in the age-sex pyramids. At the other end, the oldest age category (with the one exception of domestic service) is smaller than the preceding category. But no such generalities can be made for the three intermediate age categories; they are distributed in many patterns.

At the sector level, the results are as anticipated. The Extractive sector has a heavy negative percentage net shift, accounting for nearly one-half (46.3%) of the total. Transformative has a negative total of 29.6%, and together with Extractive and Personal services (22.6%) it accounts for virtually all (98.5%) of the total negative shift. In the Transformative sector the youngest age category (15-24) is 17.2% less than expected. Within the sector, construction follows the overall pattern closely, but food and textiles both have large negative magnitudes for nearly all age categories. Whatever the reason, and it is probably linked to technological factors and changes in product demand, neither industry is able to attract its "share" of workers.

In Personal services, it is domestic service that has high negative figures for all age categories. Eating and drinking has an unusual pattern, for employment in the youngest age category expanded remarkably, the net shift being nearly as large (84.1%) as the total for 1960. The other age categories are all negative, but not nearly enough to offset the 15-24 category. Whether it is true that youth will be served, it is here evident that youth will serve, especially in the fast-food chains that have grown so rapidly since 1960.

Turning to the sectors and industries with net shifts greater than expected, it can be no surprise that Social services is the dominant sector, with more than three-quarters (76.8%) of the total positive net shift. It is particularly notable that all individual Social service industries expanded faster than expected (except for two age categories in postal services). Moreover, the majority of net shifts in the various age groups throughout the Social services is at least one-third of the 1960 employment in each specific category.

Examining the absolute figures for net shifts, we find nearly little difference in the three youngest age categories, and the drop-off to age 55-64 is not a sharp one. Education is numerically the largest industry within the sector, and above average growth was particularly important in the two youngest age groups. Government, the second largest industry within the sector, not only had less impressive growth but it was concentrated quite equally in the 15-24 and the 45-54 age groups, a most unusual pattern. The explanation for this is not known, but as we shall see, it is the consequence of the male distribution, since the female pattern is quite different.

Producer services is the other sector with more than expected growth. Its total positive net shift is 19.4%, with Social services accounting for all but 3.8% of the total positive net shift. By age group the distribution is relatively even, much more so than for Social services. The industries within the sectors show more variation (insurance has negative signs for the younger ages) but basically they conform to the overall pattern.

By contrast, one remaining sector, Distributive, has quite contradictory industry patterns that make the overall sector pattern of very little change a deceiving one. Transportation has all negative signs and retail trade three out of five, but they are quite small in their effects, none being in excess of 10% of the 1960 size, with the exception of the oldest category in transportation. Wholesale trade has a rather even pattern of positive net shifts by age, but the pattern for communication is a broken one.

Before attempting to draw conclusions about the total labor force, let us refer to the male and female distributions (Tables IV-6 and IV-7) for whatever light they can shed on the matter. Since males are 62% of the labor force in 1970 they tend to dominate, but the variation in female employment by sector is such that their impact can be considerable for particular sectors or industries. Moreover, females have higher growth rates (k values) for all age groups, and this translates into an absolute intercensal growth much greater than for males (5.8 versus 1.8 million). In the absolute distribution of individuals by sex for 1970, it is common for males to have the largest representation in the 25-34 age group, but this is not true for females because child bearing and child rearing tend to keep them out of the labor force at this time. Females are much more likely than males to have their peak representation in the 15-24 age group, especially in retail trade, Producers' and Personal services.

On the sector level, females have a strong negative pattern in the Extractive and Personal service sectors, the difference being that they are much less important in Extractive, but more important in Personal services. In the latter, whereas males had a 19.4% positive figure for the 15-24 age group, it is -26.0% for females. Within Personal services, the industries have similar patterns for males and females, with the most prominent exception being barber and beauty shops. For men there is a net negative shift but for women there is a strong positive relationship, especially in the youngest age category. The different technology and scheduling in barber shops compared to beauty shops has been well described by Wilburn (1969).

In the Transformative sector the actual growth of females in relation to the expected growth was much less as compared to males, with the effect somewhat stronger in the younger ages. Internally, the patterns are similar by sex, with machinery being the exception, having a positive net shift for both sexes.

The Social services are even more important for females than for males in providing for positive net shifts; 81.9% compared to 58.5%. Both sexes have greater than expected growth in all age groups. While young women were brought into the postal service in larger than expected numbers, their pattern of government is a mixed one, with an overall negative balance.

Producer services does not have as great an impact on the percentage net shift for females as for males, with the youngest age group having a slight negative shift. Perhaps the demand in banking and insurance in particular, is being met by the substitution of office machines for personnel. Miscellaneous business services, a hodge-podge of activities, shows strong growth for both sexes.

The disparate trends in Distributive, evident in the total figures, shows up as even more complicated when considered by sex. For example,

transportation is negative in shift for males, but positive for females, save the oldest category. The reverse patterns are found in communication. Wholesaling is an important basis for shift shares for males, but it is of minor importance for females. The sign patterns for retail are similar for both sexes: positive for the youngest and oldest age groups and negative for the intermediate groups.

The shift approach allows us to consider once more the question of the relative importance of age groups in accounting for the sectoral transformation. The data of Table IV-9 was computed from the information provided in Tables IV-5, IV-6, IV-7 and is given for the total population, males and females in three panels. We examine first the upper panel on the total population.

The first column shows the actual sectoral changes in the percentage distribution of the total labor force from 1960 to 1970, and we see that the Extractive sector declined by 3.3 percentage points while Social services increased by 5.5 percentage points. Each of the other five columns by age shows the percentage point changes in the distribution that would have occurred if only one age group had changed as it actually did while the other four age groups had changed as expected, that is, had changed such that their 1970 distributions across sectors had remained the same as in 1960. Thus, the second column of Table IV-9 shows the change in the percentage distribution of the total labor force under the assumption that the actual 1960-1970 changes were experienced by only the youngest age group, the third column shows the changes that would have occurred if actual changes were experienced by only the 25-34 age group, etc.

The changes shown in each of columns 2-6 of Table IV-9 represent the differences between the actual 1960 percentage distribution and the expected 1970 distribution. The latter was computed directly from the "Number in Labor Force, 1970" and "Expected Value" columns of Table IV-5. For example, under the assumption that only the 15-24 age groups changed as expected, the 1970 distribution was calculated by: 1) summing, for each sector, the actual number in the 15-24 age group in 1970 and the expected 1970 employment values of the four older age groups, which yields an employment total for each sector; and 2) dividing each sectoral total by the total labor force in 1970, which gives the percentage of the labor force employed in each sector in 1970. This derived 1970 percentage distribution then was subtracted from the actual 1960 percentage distribution, resulting in a decline in the Extractive sector of the total labor force of .8 percentage points, a decline in the Transformative sector of 1.1 percentage points, an increase in the Distributive sector of .4 points, etc. (see panel 1 and column 2 of Table IV-9).

Columns 2 through 6 of the table enable us to compare the effects of the actual changes in each age group upon the sectoral distribution of the labor force. The results reinforce those obtained from the shift analysis. It can be seen that the youngest age group had the largest impact upon the declining Extractive and Transformative sectors, but a relatively small impact upon Producer services and the same magnitude of effect upon Social services as the 25-34 and 35-44 age groups. It is also evident that the three youngest age groups had substantially larger effects than did the two older age groups in only two sectors: Transformative and Social services. Definitely, the oldest age group had the least effect, yet even this age group contributed substantially to the decline in the Extractive sector and to the growth in Social services.

Transformative	- .9	- .7	- .6	- .6	- .1	.0
Distributive	.6	.5	.2	.2	.2	.1
Producer's Services	1.2	.1	.3	.3	.2	0
Social Services	3.4	.6	.6	.6	.7	.4
Personal Services	- .4	.4	0	0	- .2	0
Female						
Extractive	-1.2	- .3	- .2	- .2	- .3	- .3
Transformative	-2.7	-1.1	-1.1	-1.1	- .4	- .2
Distributive	.1	.3	- .2	.1	.2	.2
Producer's Services	1.4	.2	.6	.6	.6	.4
Social Services	7.2	1.7	1.9	1.7	1.0	.6
Personal Services	-4.7	- .7	-1.0	-1.1	-1.0	- .7

There are no remarkable differences in the effects of the five age groups upon the sectoral transformation. Moreover, a scrutiny of columns 2-6 with the first column makes it quite clear that no one age group by itself could have effected a pattern of sectoral shifts similar in magnitude to the actual shifts which occurred. These conclusions for the total employed labor force hold for male and female as well. The magnitudes, of course, differ by sex, but the patterns are similar so they need not be discussed in detail.

Conclusions

Because of the large amounts of data that have been put before the reader in this chapter, it is desirable to end with some general statements that may serve to underscore the importance we attach to the role of age in the transformative process. While here as elsewhere in this report a decade is a rather short interval to analyze in terms of structural change, age as a variable does demonstrate some rather clear patterns.

Sex differences by age are a prominent feature of this chapter, perhaps best appreciated through the medium of the age-sex pyramids. The remarkable growth of female employment during the sixties made this sex more volatile in change than the much more slowly growing males. To that extent, females are more "interesting" to analyze than males.

One of the features of the net shifts presented in Tables IV-5 through IV-7 is the fact that the signs for the five age groups within both sectors and industries go in the same direction, that is to say, they are either all positive or all negative. This holds for all sectors except Distributive. Transformative has a positive 0.3% shift for the 55-64 age group but all other groups are negative, so it is hardly an exception. On the industry level there are more exceptions, concentrated in the Transformative, Distributive and Personal services. This pattern of sign consistency could have been predicted for industries that either grew much less than expected (e.g. agriculture) or much more (e.g. education), but its general pervasiveness comes as something of a surprise.

Another feature of the net shift is the relatively narrow range that it displays as a percentage of the 1960 size. That is, the variation by age category generally is not extreme. If one age group is growing much more rapidly than expected then the others will also, and vice versa. For example, for all age groups the range in Extractive is from -37.8 to -75.1 and in Social services from 31.1 to 60.4. Again, there are exceptions to this generalization, but the pattern is undeniably present and it is not an obvious one. The variation in numbers in age groups and the differential growth of the age groups could have led us to predict a substantially different pattern, with great variation especially in the extreme age groups.

The proportion of the total positive net shift accounted for by Social services is remarkable: 76.8% for total, 58.5% for male and 81.9% for female. This last figure especially is impressive, since it must be remembered that the net shift procedure already controls for the increase in labor force participation of women during the 1960-1970 decade. The 81.9% is, therefore, in addition to the strong growth that took place as a result of the overall increase of the age groups.

What has become so apparent by now that it would hardly seem to bear repeating is the variation and diversity that the variable of age assumes by sectors and industries. What is important to emphasize is that there is nothing mechanical or indeed obvious about the ways through which age operates in the transformative process; it strikes us as a rather complex matter and by no means have the analytical possibilities inherent in the subject been exhausted. As we had reason to lament upon earlier, some of the most important questions cannot be handled adequately by recourse to census data. Only large-scale surveys -- large because they are needed to provide the necessary detail -- designed to obtain retrospective questions about labor force behavior, can be expected to provide satisfactory answers to questions about origins and destinations.

Chapter V

THE INTERRELATIONSHIP OF INDUSTRY AND OCCUPATION

If we are to understand how the process of labor force transformation takes place we need to have a theory of work allocation that can encompass the various dimensions of work position and how they are interrelated. We do not have such a theory at this time, partly because the inclination has been to consider each dimension separately and in isolation from the others.

Sociologists, for example, have long considered work almost exclusively from the perspective of occupation, which is used to develop hierarchies of social stratification and the forms of social mobility that occur within them. (See Boudon, 1973, for a recent survey of the field.) But rarely do sociologists attempt to incorporate industry position in the interpretation of social stratification and social mobility. Perhaps the most notable example of this point is the fact that Blau and Duncan (1967) in their very influential study, The American Occupational Structure, collected information on industry positions of the respondents as well as those of their fathers and fathers-in-law, but they almost completely ignored these data, using industry position only to make minor refinements in their occupational coding, but not as an analytical variable in its own right. Probably the main reason for the neglect of industry position in the study of occupational mobility is the fact that occupational positions can be ranked to form a hierarchical ladder of status (although there are evident difficulties with all such rankings). In contrast, industry positions do not lend themselves to the formation of a status hierarchy.

But industries and sectors do vary in the degree to which they have different occupational mixes; that is, in the varying proportions of high or low-status occupations they display. This means that the differential growth of industries and sectors will directly affect the total occupational distribution and consequently will affect the probabilities of social mobility for those in the labor force.

After all, industry position logically is prior to occupational position. We say logically prior because anyone in the labor force must simultaneously occupy an industry and an occupational position. But the reality of the creation of specific work positions is that specific enterprises are created within specific industries. Then, when enterprises are formed, someone within them must recruit individuals to occupy specific occupational positions. Of course, the availability of certain occupational skills constrains the kinds of industries that develop; doubtless, a number of oil-rich nations have the investment capital to start high-technology industries, but they do not necessarily have the trained manpower to operate them. Which brings us back to the initial point: industry and occupation are interrelated, and they should be analyzed as such.

Such a task in all of its ramifications is far greater than can be attempted here. It would be preferable to have data directly on the enterprises themselves, rather than to depend on our indirect approach which relies upon information on individuals occupying particular industry positions as designated

by the Bureau of the Census. Of course, the occupational titles reported for individuals in the census may not accurately reflect their actual work activities. Moreover, even accepting the population data on industry and occupation, their full potential will not be exploited. Even though the three-digit census codes for industry and occupation provide information on hundreds of titles, the analysis reported here will be restricted to the six sectors and the 37 industries and just eleven occupational classes. Eventually, research in this area should make use of the full range of the two and three digit classification, but for the largely exploratory purposes of this chapter, the more gross categories must suffice. Parenthetically, Gibbs and Poston (1975) have demonstrated that division of labor measures, created from U.S. census industry and occupation categories, produce much the same results whether gross, intermediate or detailed classifications are used.

It also should be made clear at this point that the purpose of this chapter is not to seek a comprehensive explanation of why industry-occupational configurations assume the patterns they do. The answers to the questions that arise from such an endeavor would lead us directly into the "motor" of economic growth and development and a consideration of the demand-supply factors that influence the industry-occupational patterns and their change. This cannot be attempted here, at least in more than passing fashion. Our concern is with the allocation of labor itself and how it is transformed over time. This offers many challenging problems in its own right. It is assumed that sectors and industries have differing occupational requirements such that most industries will have occupational profiles (even using the gross occupational categories) that clearly differentiate them from other sectors and industries. More than this, it is also assumed that even for so short a period as the 1960-1970 decade there can be significant differences introduced into the industry-occupational structures.

Logically, there are four combinations of industry-occupational change:

Type 1. There is growth (positive or negative) in numbers, but no proportionate change in the industry-occupational configuration; the pattern therefore remaining the same.

Type 2. There is a change in the industry-occupational configuration (possible under conditions of positive, negative or no growth), but it is accountable for solely by shifts in the industry distribution, the occupational profiles within industries remaining unchanged. For the total labor force the occupational distribution must change but <u>not</u> within industries.

Type 3. The reverse of Type 2. The industries do not change, but the occupational distributions within the industries change.

Type 4. With or without the growth of the total labor force, both the industry and occupational configurations change.

As already intimated, it is Type 4 which is overwhelmingly encountered in both developed and developing countries. Possibly, under pre-industrial conditions Type 1 was approximated, where there was little economic development and slow population growth. Of course, Types 2 and 3 are stated in stringent terms and if they were restated to mean only that the predominant change was of the occupational structure within industries or of the industry structure itself, these patterns would be empirically more likely to be encountered.

In Table V-1 the occupational distribution for the total labor force for 1960 and 1970 is given for 11 categories. The only modification of the conventional one-digit classification is the division of professional into professional and semi-professional (see Appendix D for allocation). As is well known, farmers and farmer laborers declined by about 50%, operatives and laborers over 10%. In contrast, professionals and semi-professionals increased by over 25% and clerical by nearly 20%. The remaining occupational categories are more or less holding their own.

The configuration for the entire labor force is well known, but what should we expect for sectors and industries? Will they not have their own sets of "imperatives" that serve to mold their occupational distributions? The array of factors that can impinge upon these distributions -- i.e., the demand and supply of trained manpower, the investment decisions of private firms and of governments, the infusion of technology, the kinds of discrimination practiced against minorities and females -- is so large and varied that no attempt can be made to fully "explain" the patterns that can be detected. In any event, as noted in the introductory chapter, we are interested primarily in <u>how</u> the labor force changes rather than <u>why</u> it changes.

Tables V-2, 3 and 4 present the occupational distributions within the six sectors for 1960 and 1970 and both the percentage point difference and the percentage change for the 1960-70 period. (Rather than taxing the reader's eyesight and patience with comparable distributions for each of the 37 industries we will refer to industries only when they seem to offer a distinctive point.) The distributions and their changes are complex and cannot easily be summarized.

There is a greater concentration in a few occupational categories by sector than was true for the entire employed labor force. To no one's surprise, farmers and farm laborers together account for over two-thirds of employment in the Extractive sector. What does command our attention is the appreciable decline in this total between 1960 and 1970, something over 10 percentage points. Although the professional and semi-professional categories grew by only 2 percentage points, their percentage change was over 100% during the decade. In agriculture (mining has a different pattern) the growth of these two occupational categories may be said to represent a diffusion of expertise. In agriculture this means not only professional agronomists and engineers but also increases in managers, clerical and sales, all a sign of the developing agribusiness. The 1960-70 trend may be expected to continue.

No other sector has so great a concentration as does Extractive in just two categories, but Personal services, even in 1970, had nearly 60% (58.42) in service occupations. Transformative had -2.57 percentage point decline from 1960-1970 in the proportion who were craftsmen, operatives and laborers (68.41%

Table V- 1

OCCUPATIONAL DISTRIBUTION OF THE TOTAL LABOR FORCE, 1960-1970

% Point Change	-14.84	.00	.00	.00	.00	.00
Percentage Change	-26.82	---	---	---	---	---

NOTE: Computed from Table

in 1970). Professionals and semi-professionals picked up two percentage points during the decade and now have 9% of the total employment in the sector.

One generalization that holds for all six sectors is that the occupational category with the largest share in a sector grows either very slowly or actually declines, as is seen from the following array for both sexes:

Sector	Largest Occupational Category	Percentage Increase 1960-1970
Extractive	Farmers	-18.57
Transformative	Operatives	-2.78
Distributive	Sales	-6.67
Producer services	Clerical	+2.43
Social services	Professional	-1.09
Personal services	Service	-1.57

We have here a consistent pattern, and note that for each sector a different occupational category is the largest one, an indication of the differences that occupations present within industry sectors. One of the ways the labor force is changing, therefore, is for at least some of the other occupational categories to have more rapid growth.

But what about the sexual differences, which are often important in this study? By examining the largest occupational categories for males and females separately, will we find the pattern confirmed?

Sector	Largest Occupational Category	Percentage Increase 1960-1970
Extractive		
Male	Farmers	-17.66
Females	Farm laborers	-26.82
Transformative		
Male	Craftsmen	3.01
Female	Operatives	-3.37
Distributive		
Male	Operatives	-3.62
Female	Clerical	8.40
Producer services		
Male	Sales	-5.89
Female	Clerical	-3.42
Social services		
Male	Professional	13.24
Female	Professional	-11.18
Personal services		
Male	Service	12.45
Female	Service	-5.32

In most sectors there are different occupational categories for males and females that are the largest; only Social and Personal services are identical (and for Social services, clerical very nearly is as large as professional). What is more, only in two sectors (Extractive and Producer services) do the largest

occupational categories change in the same direction for both sexes. In Social services, for example, the figure for both sexes (-1.09%) is made up of a gain for males (13.24%) that is more than offset by the loss for females (-11.18%). The generalization we posited for both sexes holds only for females but not for males.

The meaning of the "diffusion" of occupational categories within sectors can be elaborated by developing somewhat more the example of professionals and of clerical. As earlier stated, the professional (and semi-professional) categories can be conceived of as indicators of expertise. In the 1960-1970 decade it is in those sectors with a low representation in these categories (Extractive, Distributive and Personal services) that had proportionately large gains. On the other hand Social services which had a large share (42% of total employment) in the two professional categories, actually declined during the decade. Consider specific industries within the Social services sector. Medical services had a marked decline, from 54% to 39% of the share the two professional categories represented of total employment. (This decline occurred for both males and females.) In contrast, service occupations rose for both sexes from 16% to 36%. We interpret this to mean that in these industries there is an effort to better utilize the labor of high professionals by taking on more low-paid help in the form of service workers. In contrast, hospitals, as an industry also in the field of health, showed much less of a decline in the two professional categories (40% to 37%), while services increased one percentage point to 40%. These changes in medical and hospital services during the 1960 to 1970 decade served to bring their occupational distribution closer together. Education within Social services is also an example of a prominent decline in the proportion professional and semi-professional during the decade: from 67% to 59%, with most of the decline due to females. This decline was offset by a substantial rise in managers for males (3% to 9%) and clerical for females (.4% to 23%). In this instance males doubtless had a net gain in earnings while females had a net loss.

Clerical is an interesting occupational category. For some decades it has been one of the fastest-growing categories, and by 1970 it had become the single largest category, representing 18% of total employment. It is also an instance of marked sexual differences, for it is the one broad occupational category dominated by females, representing nearly three-quarters of total clerical employment. In no sector in 1970 do males have more than 14% of their employment in clerical, whereas only in Personal services are females less than 24%, rising to as high as 76% in Producer services.

We may take the rise of the clerical occupations within industries as an indicator of bureaucratization, for it is this group that carries the burden of "structural communication" that Weber included as a component of his classic definition of bureaucracy (Frisbie, 1975). We can therefore predict that all sectors and industries should show a relative gain in clerical, even at different rates, because all are subject, to one degree or another, to the pervasive influence of bureaucratization. But as with the earlier generalization about the largest occupational category in the sector, the degree of relative increase should depend upon the proportion of the total labor force that is clerical at the beginning of the period; the higher the proportion the slower the rate of increase.

The prediction is confirmed for the total population, with all six sectors having positive growth in clerical, and Extractive and Personal services, the sectors with the lowest 1960 representation in clerical, having much the largest percentage increases. For males, however, three sectors had negative growth, while two sectors of the females had declines. On the industry level, for both sexes there are instances of negative growth, though all but three are four percent or less. As already mentioned, medical had a sharp decline (-24%), while government (-10%) and communication (-8%) dropped less so.

More could be derived from Tables V-2, 3 and 4, not to mention a detailed analysis of individual industries. One could also introduce black-white comparisons, but our intention in this chapter is not primarily a consideration of who occupies what positions, but to demonstrate the interrelations of industry and occupation. We have established that there is much variation by occupation within sectors, as witness the earlier finding that each of the six sectors had a different occupational category as its largest one. This suggests that as the industry structure of employment changes, there are related changes in the occupational structure.

The Shift Approach Applied to Industries and Occupations. Despite the fact that many occupations are closely linked to specific industries, such as farmers to agriculture and transportation equipment operatives to transportation, there have been few attempts in the literature to study the linkage between the industry structure and the occupational structure. One early effort that unfortunately never received much attention was undertaken by Palmer and Miller (1949), who decomposed the growth of occupations into three components: the growth effect, the industry effect, and the occupation mix effect. The growth effect refers to that part of employment growth which could have been predicted on the basis of the growth of the total labor force, independent of any changes in the industry or occupational structures. The industry effect is the influence of the changes in the industry structure of the total labor force on a given occupation. Finally, the occupation mix effect refers to that part of the change in an occupation that is due to changes in the occupational distribution within industries.

This approach was later picked up by Ganasekaran (1966) in his paper "Interrelations Between Industrial and Occupational Changes in Manpower, United States, 1950-1960."

Our own approach received its original inspiration from these authors, but in the present formulation it has moved away from the idea of a threefold decomposition of occupational change to one of two categories: an industry shift effect and an occupation shift effect. Actually, although the industry-occupational analysis was carried out independently of the age analysis reported in Chapter IV, we gradually became aware of the similarity of the two approaches, as was also the case of the analysis of the 1965-1970 inter-sector changes of employment reported in Chapter III.

All have in common the shift share conception of decomposing change, and all depend upon the idea of comparing actual with expected change. In this section, we want to be able to identify what share of the change in the occupational structure was due to the changing industry structure that occurred during

the 1960-1970 decade and how much of the occupational change was due to the variations in demands for occupational categories within the sectors and industries. It is not a procedure that is intuitively readily understood so our first step in examining Table V-5 will be to explicate the meaning of the various columns, using professionals in that table as our example.

Explication of Technique. Columns 1 and 2 are the actual numbers of persons in each of the eleven occupational categories. The totals of each column thus show the total labor force in 1960 and 1970, respectively. (It should be pointed out, again, that these figures were drawn from the 1/100 Public Use Sample, and they are not directly comparable to published tables.)

In Column 3 the 1970 labor force is distributed among the occupational categories in exactly the same proportions as is found in 1960. In other words, we assume that each occupational category grew at the same rate as the total labor force, thus keeping its proportionate share. Since the labor force expanded by 16.7% between 1960 and 1970, we multiplied each of the eleven categories by the same growth factor (714,839/612,494 = 1.1670955).

In Column 4, we assume that between 1960 and 1970 there were no changes in the occupational structure within industries, and therefore permitted only the industry structure to change as it did. Thus, we distributed the 1970 employment in a given industry among the eleven occupational categories in exactly the same proportions that were observed in 1960. Consider the example of medical services. In 1960, 44.8% of total employment in this industry was professional; we therefore assume that in 1970 44.8% of total employment in medical services was professional. This procedure was repeated in each of the 37 industries, and then the sum of these professionals in the 37 industries (75,629) is given in col.4. The sums for the other occupational groups reported in col.4 were obtained in similar fashion. This procedure involved 407 multiplications plus the summation of 37 figures for each of the eleven occupational categories. Consequently, rounding errors produced a grand total of 715,157, rather than the expected 714,839 of cols. 2 and 3, a .0005 percent error.

Column 5 refers to the actual change in each occupational category between 1960 and 1970. In our example, the number of professionals in the labor force increased by 23,833.

Expected change (col.6) is the difference between the number of persons in each occupational category in 1970 that could have been expected if each category had changed in the same way as the total labor force (col.3) and the actual number in each occupational category in 1960 (col.1). Since there was a 16.7% growth of the total labor force, all figures in col.6 are positive. Thus, the expected change in professionals (8,193) is arrived at by subtracting the actual number of professionals in 1960 (49,029) from the expected number in 1970 (57,222).

Although the actual change in each occupational category is important in its own right, the focus of this analysis is on the relationship between the occupational structure and the industry structure. It is not so much the absolute growth of an occupation in which we are interested, but is relative growth in comparison to the other occupations. In other words, we want to know

Table V-5

COMPONENTS OF OCCUPATIONAL NET SHIFT, 1960-1970, FOR TOTAL EMPLOYMENT

Occupational Category	Number Employed 1960 (1)	Number Employed 1970 (2)	1970 Total Weighted by 1960 Occup. Distr. (3)	1970 Total Weighted by 1960 Occup. Distr. Within 37 Indus. whether an occupation increased or decreased its share of total employment between 1960 and 1970 and what the sources of this change are. To that end, we computed the net shift (col.7) by subtracting the expected change from the actual change. Positive net shifts indicate that these occupational categories increased more than expected, while negative net shifts are obtained when the actual is smaller than the expected change. Column 7 shows that the actual growth of professionals far exceeded their expected growth, resulting in a net shift of 15,640.

Columns 8 and 9 present the components of the net shift. Column 8 is termed the "industry shift effect," which is the effect of the changes in the industry structure on the net shift of the occupational structure. These figures are derived by subtracting the number of persons in each occupational category in 1970 had there been no change in the occupational structure in 1960 (col. 3) from the number of persons in each category in 1970 that would have been observed had only the industry structure of the labor force changed between 1960 and 1970 without any changes in the occupational distribution of employment within each of the 37 industries (col.4). To interpret col.8 we need to return to the meaning of cols. 3 and 4. Column 3 posits a 1970 occupational distribution based on the assumption that there were no changes in the occupational and industry structures of employment. Column 4, in contrast, permits the distribution of total employment among the 37 industries to change the way it actually did, holding constant only the occupational distribution within industries. Therefore, by subtracting col. 3 from col. 4, we capture in col. 8 the amount of occupational change that occurred as the result of the industry changes between 1960 and 1970. A positive industry shift indicates that changes in the industry structure of the labor force results in a larger than expected increase in employment in that occupation, whereas a negative industry shift indicates that the changing industry structure did not favor that particular occupation. Consider the case of professionals. Without any changes in the proportion of professionals in each of the 37 industries during the 1960-70 period, the changes in the industry structure would have resulted in an increase of 18,407 professionals.

In Column 9 we subtract the number of the number of persons in each occupational category in 1970 that would have been observed had only the industry structure of the labor force changed between 1960 and 1970 without changes in the occupational distribution of employment within the 37 industries (col. 4) actual number of persons in each occupational category in 1970 (col. 2). Since the figures in col. 2 are the result of changes in both the occupational distribution of employment within industries and the industry structure of the labor force, subtracting col. 4 from col.2 yields the amount of occupational change that occurred as the result of change in the occupational distribution of employment between 1960 and 1970. Positive occupational shifts note that changes in the occupational distribution of employment within industries favored an increase of employment in an occupation that was faster than that of the total labor force, while negative occupational shifts contributed to a slower growth of employment in an occupation as compared to the labor force. In the case of professionals, the changes in the occupational distribution of employment within industries would have resulted in 2,767 less professionals than expected had the industry structure of the labor force not changed.

Columns 10 and 11 express the industry shift effect and the occupational shift effect as proportions of the total net shift. It can be seen from these

figures that the proportionate increase in professionals entirely was due to the changing industry structure of the labor force. In fact, the proportionate increase of professionals would have been even more pronounced had there not been a negative occupational shift effect.

Interpretation of Occupational Net Shifts. Table V-5 shows that only the two farm occupational categories decreased in absolute numbers (col. 5). We pointed out earlier, however, that it is not so much the growth of the labor force in absolute numbers which interests us, but rather the changes in the relative standing of the various occupational categories. In other words, we are concerned with changes in the occupational structure.

The changes in the occupational structure are given in col. 7, which contains the net shift between 1960 and 1970 for each occupational category. This column is comparable to the data in Table V-1: wherever negative net shifts occur in col. 7 of Table V-5, Table V-1 shows that particular occupational category had a smaller share of total employment in 1970 than in 1960. These changes already have been discussed in an earlier part of this chapter and need not be repeated. The purpose of this analysis, instead, is to identify the relative magnitude of the industry shift effect and the occupational shift effect on the changes in the occupational structure of the labor force between 1960 and 1970.

We will begin with the farm occupations, since their changes are the easiest to interpret. It can be seen in Table V-5 that the number of farmers as well as farm laborers not only grew less rapidly than the total labor force (col. 7), but actually declined absolutely (col. 5) during the 1960's. There were 17,304 fewer farmers and farm laborers in 1970 than ten years earlier. The decline of farmers was largely due to the industry shift effect (cols. 8 and 10). As agriculture declined (which is the only industry in which farmers and farm workers are to be found), the number of farmers decreased as well. But the occupational shift effect also contributed to the decline in the numbers of farmers, although to a much smaller extent (col. 11). For farm workers, the situation is a bit different. Although they, too, had a smaller share of total employment in 1970 than in 1960, this decrease was entirely the result of the changing industry structure, i.e., the decrease of employment in agriculture. These findings are quite consistent with the general changes in agriculture during the past decades. During that time agriculture has more and more taken on the character of agribusiness; small farmers have declined to a large extent and a limited number of farms now accounts for an ever-increasing share of total cultivated land. These developments brought with them the introduction of large corporations and, as a result, an increasing share of laborers, professionals, and even clerical workers is needed.

Table V-5 identifies several other occupational categories where growth did not keep pace with the expansion of the total labor force between 1960 and 1970. All three manual occupations (craftsmen, operatives, and laborers) experienced a relative decline in their shares of total employment. In the case of craftsmen, the decline was very much the result of the shift of employment from industries which employ large proportions of craftsmen to industries that employ smaller proportions of craftsmen. Only 9.4% of the net shift was due to the fact that within industries the employment of operatives decreased during the 1960's. A similar general pattern exists for operatives and laborers,

except that in both of these cases, while the industry shift effect was the main source of the negative net shift, the occupational shift effect contributed a substantial proportion (34.5% and 42.3% respectively) to the negative net shift. These findings are consistent with the earlier discussion of the decline of the share of total employment in the Transformative sector. Since employment in Transformative industries is concentrated in these three manual categories (in 1970, two-thirds of all workers in the Transformative sector were craftsmen, operatives, or laborers), the decrease in the proportion of the labor force in these industries resulted simultaneously in a decrease in the proportion of total employment in these occupational categories.

The other two occupational categories that expanded more slowly than the total labor force are managers and sales workers. In both cases, the negative net shift was the result of occupational shifts within industries. In fact, the industry structure of employment changed in such a way as to favor the growth of employment in these two occupations. But since the industry shift effect was not as strong as the occupational shift effect,managers and sales workers expanded less than the total labor force.

Four occupational categories benefitted from the net shifts (professionals, semi-professionals, clerical, and service workers), but the findings in Table V-5 show clearly that the disproportionate growth of employment in these occupational categories was the result of different patterns. For professionals, it was wholly due to changes in the industry structure. As employment shifted towards services in general, and Social services in particular, which traditionally employ larger proportions of professionals than goods-producing industries, professionals as proportion of total employment grew as well. A similar trend is observed for semi-professionals, but here only two-thirds of the shift was due to the industry effect. Table V-5 shows, moreover, that the changes in the occupational distribution of employment within industries had the opposite effect on professionals: in 1970 proportionately fewer professionals were employed within industries than ten years earlier. This deflating impact on the growth of professionals, however, was not strong enough to neutralize the influence of the industry shift that favored the growth of professionals.

The changes in the employment of service workers, which also expanded more than the total labor force, was nearly the opposite as that for professionals. This disproportionate growth very largely was the result of changes in the occupational distribution within industries. Since professionals and service workers are found in services in larger proportions than in goods-producing industries, their opposite patterns can be interpreted in relation to each other. It appears from the trends of professionals and service workers that there is a tendency within industries to employ service workers for positions that formerly were held by professionals. The best example of this are hospitals, in which nurses' aides (who are service workers) perform more and more functions that formerly were carried out by nurses (who are professionals). This trend is quite comparable to the attempts within Transformative industries, for example, to standardize work as much as possible. The fewer case-by-case decisions there are to be made, the less skilled personnel are needed. It therefore can be expected that as service establishments become larger in size and more bureaucratized, they will employ a decreasing proportion of professionals; service workers should be one of the occupational categories benefitting from this change in the occupational distribution.

The largest proportion of the total positive net shifts (40.9%) is accounted for by clerical occupations. The disproportionate growth of clerical occupations resulted almost equally from the changes in the industry structure and the occupational distribution of employment within industries, with the occupational shift effect being slightly more important than the industry shift effect. These findings suggest that clerical occupations not only expanded as a result of the growth of industries, such as Producer services which use large proportions of clerical workers, but that their growth also resulted from the fact that within the industry sectors larger proportions of clerical workers were employed. With work being carried out more and more within formal organizations, clerical-type activities have increased remarkably and with them the number of clerical workers.

What can be said about the industry versus occupational effect for all employed persons, rather than for particular occupational categories? In Table V-10 we see that for the total employed, two-thirds of the occupational change is accounted for by the industry shift effect. This figure was arrived at by first summing in col. 7, Table V-5, all positive net shifts. (This same figure could be derived by summing total negative net shifts, since the two sums cancel each other.) We then summed the industry shift of all those occupational categories with positive net shifts (col. 8, Table V-5), and the same was done for the occupational net shift effect (col. 9, Table V-5).

We have also made the same calculations for the four sex-race groups, and we find (Table V-10) that for white males, white females and black females, changes in the industry structure were an even more important source for occupational change, ranging from three-quarters to four-fifths of the total. For those three groups, very little occupational change was due to changes in the occupational distribution within industries. The one exception is black males, for which the industry effect was only 42.2%. This comes as a surprise, for as we will demonstrate later in Chapter VII, black males experienced much greater change in their allocation to industries than white males. We therefore would have anticipated that the industry shift effect would have been the larger component. This finding suggests that for black males the industry shifts have not resulted in employment in different occupations to the extent that could have been expected. This reasoning comes up against the pattern for black females, which is quite different than for the black male pattern. We don't have the explanation for this difference, but we suspect that the large industry shift effect for black females is the result of their remarkable decline in domestic service, from 38% in 1960 to 18% in 1970.

SEX-RACE DIFFERENCES IN THE PATTERNS OF OCCUPATIONAL CHANGE

We now turn to a cursory examination of Tables V-6, 7, 8, and 9 where the same procedure as for the total employed is applied to the four sex-race groups. Our main attention will be devoted to those instances where there are significant deviations from that demonstrated by total employment.

Farmers and farm workers display much the same pattern for the four sex-race groups as for the total labor force. In each instance the relative decline of these two occupational categories mainly resulted from the industry shift effect, that is, the decline of employment in agriculture, the only industry in which these workers are to be found.

Table V-10

COMPONENTS OF OCCUPATIONAL CHANGE FOR TOTAL EMPLOYED AND RACE-SEX GROUPS, 1960-1970

		NET SHIFT DUE TO:			
	Total Positive Net Shift	Industry Shift Effect (Number)	Occupational Shift Effect (Number)	Industry Effect (Percent)	Occupational Effect (Percent)
Total Employed	50,001	33,600	16,401	67.2	32.8
White Males	23,288	17,627	5,661	75.7	24.3
Black Males	5,201	2,197	3,004	42.2	57.8
White Females	12,273	9,948	2,325	81.1	18.9
Black Females	6,378	5,029	1,349	78.8	21.2

Next, we will consider the three manual occupational categories, craftsmen, operatives and laborers. For craftsmen all sex-race groups experienced a positive net shift. Although the components of this shift differed among the groups, these differences largely can be neglected, since craftsmen are almost a negligible category for females. Moreover, the industry shift effect and the occupational shift effect, in relation to the size of this occupational category, were minute for three of the groups. Only black males experienced a substantive occupational shift effect and, consequently, a 33 percent increase in the share of employment in craft occupations. For operatives we again observe a difference by race: whites experienced a proportionate decrease whereas blacks had a proportionate increase. This finding is not unexpected, for we earlier had demonstrated that the proportion of black employment in the Transformative sector increased in the 1960-1970 decade. The figures show in fact that the positive net shifts for blacks mainly were the result of changes in the industry structure (this component was the sole source for black females).

For laborers there is a sex difference for net shifts. For males the proportion declined while it increased for females. There are differences by sex and race in the way the components produced these shifts, but the combinations are different for each group and therefore cannot be readily interpreted. It is interesting to note, however, that for black males the proportionate decrease of laborers mainly is due to the occupational shift effect. In other words, it was less the increase of black males in Transformative industries (see Chapter VII) which contributed to this shift from laborers to operatives, but rather change in the way black males were employed within industries.

As in the case of laborers, the trends of managers and sales workers are quite different for the four race-sex groups. On the one hand, similarities exist in the sense that for all groups but white females there were positive net shifts for the two occupational categories. On the other hand, however, the ways by which changes in the industry structure and changes in the occupational distribution within industries contributed to the net shifts of these two occupations differ among the four race-sex groups.

Let us first take up the case of managers. For all four race-sex groups, the industry shift effect favored an increase in the number of professionals, but the magnitude of this effect differed widely among the groups. The effects of the occupational shift differed mainly by race; for whites, changes in the occupational distribution within industries had a negative impact on the growth of managers, whereas for blacks they favored the growth of this occupational category. We should note, however, that for whites the share of employment in managerial occupations changed very little and that the industry shift effect and the occupational shift effect also are very small in comparison with the number of whites in 1960 that were managers. For that reason, the influence of the industry shift and the occupational shift for managers is relatively unimportant for whites. But this is not so for blacks. The net shift for black males represents an increase of 76.4% over the number of black males in 1960 that were managers, and a corresponding increase for blacks of 48.6%. This is the more remarkable as the net shift is independent of the growth of total employment of these two groups. For black males the industry shift effect is negligible as a source for the net shift of managers. On the one hand, the share of employment of black males in Personal services in which managers are an important occupational category declined, but this decline was neutralized by the disporportionate growth of black males in other industries, such as trade, banking and government,

in which there are also many managers. Table V-7 thus shows that the increase in the share of black males in managerial occupations predominantly is the result of occupational changes within industries. For black females, the shift of employment towards industries with high proportions of managerial occupations was more pronounced. As a result, the industry shift effect and the occupational shift effect contributed in equal proportions to the positive net shift of managers.

The shift for sales workers and their components are very similar to those of managers. But two differences merit attention. First, in the case of white females the industry shift effect and the occupational shift effect contributed to the negative net shift of sales workers, although the latter by far was the more important factor. Second, the small net shifts of sales workers for white males is somewhat misleading, since they are the result of substantial, although opposite, effects of changes in the industry structure and in the occupational distribution within industries. The figures in Table V-6 show that the change in the industry structure greatly favored an increase in the share of total white males in sales occupations, but this trend was countered, with almost the same magnitude, by decreases in the proportions of sales workers within industries. As a result, there was almost no net shift.

The proportion of employment in clerical occupations increased for all sex-race groups. For black males and white and black females, changes in the industry structure and the occupational distribution within industries contributed similarly to the positive net shift. White males only had a very small positive net shift. The small magnitude is misleading, however, for it was the result of offsetting effects: the industry shift effect favored the growth of clerical employment whereas the occupational shift effect disfavored these occupations.

Service occupations are similar to clerical to the extent that white males have a different pattern than the other three groups. For white males the share of employment in service occupations increased in contrast to the decrease for the other three groups. The situation of black females supports our earlier statement that the large industry shift effect on their occupational changes mainly was the result of the decline of black females in domestic service. Employment in this industry is exclusively service work (98.9% of all black females in domestic service were in that occupational category in 1970). As the figures in Table V-9 show, service work not only is the major occupational category for black females; it also accounted for the largest share of total net shifts.

Professionals and semi-professionals have a basically congruent pattern by sex and race. In the case of professionals, the main source of the positive net shift were the changes in the industry structure. For females the industry shift effect was the sole source of the positive net shift, since within industries there was a decreasing demand for professionals. As for semi-professionals, both industry and occupational shift effects contributed to the net positive shift. In this instance we observe a race rather than sex difference in that for whites the industry shift effect was the predominant source for the positive net shifts, while for blacks it was the occupational shift effect.

The pattern of professionals and semi-professionals for the four sex-race groups demonstrates that all groups reinforced the increase in the share of total employment in these two occupational categories. In most other categories, however, offsetting patterns were observed. For whites, the share of employment as operatives decreased, whereas it increased for blacks. In the case of laborers, males decreased while females increased. Similar sex-race differences can be found in the relative importance of the industry shift effect and the occupational shift effect for occupational changes of the four groups. In the case of professionals, for example, we observed that the occupational changes within industries did not favor the employment of females as professionals, whereas they reinforced the growth of male professionals. These offsetting patterns are the result of differences in the allocation of males and females and of whites and blacks to industries and occupations. For that reason, the next two chapters examine the position of females and minorities in the labor force.

Chapter VI

FEMALES IN THE LABOR FORCE

The growing importance of females in the service sectors is one of the more prominent and interesting aspects of the sectoral transformation of the labor force. This chapter will address itself to a variety of topics: why women are entering the labor market, what industries and occupations they fill, what degree of sex-typing is occurring, and the implications for women's status and future employment.

Female labor force participation must be analyzed differently than male labor force participation. In the prime adult years, 25-55, upwards of 95 percent of males are in the labor force and there are strong sanctions favoring work; even those who could choose to stay as members of the leisure class generally report some form of employment. But increasingly the woman has several options. She can remain unmarried or decide on a childless marriage and work full time; she can enter, leave and re-enter the labor force according to stages in her family life cycle; or she can marry and be a housewife only. Although similar options always have been available to men, it is the traditional view that women have to raise children, and it is the relation between home and work that currently makes female labor force participation such a complex and important subject.

The literature on women in the labor force is growing rapidly. Bowen and Finegan (1969) produced a major study on labor force participation, joining others like Bancroft (1958), McNally (1969), and Cohen (1969), to name only a few. Other important aspects include women in the professions (Blitz, 1974; 1973) and the relationship between marriage, fertility, and female labor force participation (Sweet, 1973; Kiser, et al., 1968). Yet another group of studies has been concerned with the societal conditions for the participation of women in the labor force (Oppenheimer, 1970; Youssef, 1974). The Human Resources Center of Ohio State University under the direction of H. Parnes published an extensive study entitled "Dual Careers: A Longitudinal Study of the Labor Market Experience of Women" for the U.S. Department of Labor (1970). All these studies agree that a woman's decision to enter the labor force is influenced by her marital status, age, race, education, presence and ages of children, husband's earnings, and even other characteristics like health and attitudes toward home.

Oppenheimer (1969) has related the historical participation of women to their family life cycles. In 1900 the highest work rate for women was for those under 25 years of age, which means that women worked until they married and then dropped out of the labor force to raise a family. This pattern changed after 1950. Single women still have the highest work rates. Married women still drop out of the labor force to raise children, but they increasingly re-enter the labor force in their late thirties. The data thus show the labor force participation of women to have two peaks: between 20-24 and 45-54 years of age.

The Parnes study found that on the whole married women have lower participation rates than single, divorced or widowed women. The rates, moreover, are lower for women with school-age children than for those with no children under 18, and the participation rate of women is inversely related to husband's earnings and positively related to the woman's level of education. The study further pointed out that for women the decision to work is made within the family context and it is much influenced by the husband's attitude and the couple's perception of family needs.

The 1973 Manpower Report of the President called attention to the remarkable increase in the number of females in the labor force during the past 35 years. Between 1947 and 1971 the female labor force almost doubled, increasing from 16.7 million to over 32 million. Yet the female population as a whole only increased 40 percent, from 52 million to 74 million. These data indicate quite clearly that today women are more likely to be in the labor force than they were 25 years ago. In 1960 somewhat more than a third (37.1 percent) of all females 16 years and older worked. This increased to 42.8 percent in 1970. Men of the same age, in contrast, decreased, falling from 82.4 to 79.2 percent between 1960 and 1970. As a consequence of these divergent trends, women comprised 32.1 percent of the total labor force in 1960 and 36.7 percent in 1970.

The question remains, however, whether the labor force will experience a continued rise in the participation of women. As Waldman and McEaddy (1974: 13) put it, "Tomorrow's working women will be affected not only by the measure of success achieved today, but also by economic conditions, changes in lifestyle (for example, smaller families) the mode of enforcement of legislation prohibiting discrimination, provision of child care services for mothers on industry payrolls, and the extent of formal education or technical training of women for traditionally male occupations." These conditions must be kept in mind when evaluating labor force projections.

Denis F. Johnston (1973), in his article "The U.S. Labor Force: Projections to 1990," predicts a modest growth for women workers, but he does not expect females to come close to males in their labor force participation rates. More and more women will enter the labor force, but never in the numbers of men, and they still will have a bi-modal lifetime participation distribution curve. Johnston notes that women were 32.3 percent of the labor force in 1960 and 37.4 percent in 1970. His projections allow only a rise to 38.5 percent in 1980 and 38.7 percent in 1990. He sees this leveling off as due to a change in age composition of the labor force, with declines in the number of young women and very small increases in the number of women 45-64 years old.

Yet only a few years after these projections were made, the actual labor force participation of women had already surpassed the figure projected by Johnston for 1990. As of April 1975, women were 39 percent of the total labor force. Of particular importance is the fact that women with school-aged children have higher participation rates than women with no children (52.3 and 43.9 percent, respectively, in March 1975). Thus, the findings of earlier

studies (e.g., U.S. Department of Labor, 1970) which suggested that the presence of children prevents women from participating in the labor force, are no longer valid in the case of school-age children. (The data for the preceding and following paragraphs were submitted to us by the U.S. Department of Labor, Women's Bureau.)

As a result of this trend, the labor force participation rate of women now has one peak in the 20-24 age group instead of the traditional bi-modal participation curve. The April, 1975 data serve as an illustration of the changing situation: 62.5 percent of all women aged 20-24 participated in the labor force. For the 25-34 age group, the rate decreased to 54 percent, and remains at that level for women aged 35-44 and 45-54 (with respective participation rates of 56.2 and 54.8 percent).

There has been much speculation in recent years regarding women's increased participation. Factors identified as responsible for this increase include the shift away from physical work in the economy, the work experience of women during World War II, the women's rights movements, the increased use of labor-saving devices in the home, and the trend towards lower fertility coupled with the increased ability to control the timing of fertility. The 1973 Manpower Report of the President, for example, emphasized how the recent sharp decline in birth rates will have a marked impact on the size and age-sex distribution of the labor force in future years. If the present two-child family persists, then labor force projections will show a 70 percent increase in the number of economically active females aged 25-34 during the 1970's. In other words, lower fertility means less family duties for the married woman and this affords more time to be in the labor force.

Victor Fuchs in his book The Service Economy (1968) contends that because most occupations in the service sector do not rely on physical strength, women are able to compete on a more equal footing with men. On this basis he foresees that the advent of a service economy should make for greater work equality between the sexes. Fuchs also notes that services are attractive to women because such jobs are more amenable to part-time work.

But Fuchs' definition and prediction of equality can be challenged. As will be shown in this chapter, a considerable amount of sex-typing on both the occupational and industrial level prevents women from attaining higher status or higher-paying jobs. Unless basic female role changes are made, the "service economy" will bring with it the same stereotyping as was brought forth by the industrial revolution. Women are still the chief child raisers in this society and until the responsibility is more fully shared, women will continue to drop out of the labor force at a crucial time in their careers. Beyond this is a world view which sees the male and female spheres in mutually exclusive terms. Fuchs is correct in postulating that the reduction of jobs requiring physical strength will open many opportunities for women; however, as the war-time experience showed, women have not been able to preserve those gains. Throughout recent decades, something else has dominated: consumer discrimination, employer discrimination, employee discrimination, and the ambivalence of women themselves, to name a few.

Fuchs recognizes this problem of roles in many of his other articles on women. He claims that role differentiation is the major explanation for the earnings differential between men and women. He believes these roles begin early in childhood with the socialization process and eventually affect labor force attachment, choice of occupation location and hours of work, post-school investment, and consumer and fellow employee attitudes.

It must be pointed out that no matter what is defined as a "woman's job," the highest paid positions in the field go usually to a man. Cooking is 'woman's work,' yet the best and highest paid cooks are men. Women care for the sick, and supposedly that's why women are nurses. If so, why are they not doctors? Women are reportedly more dextrous with their "small hands" than men, and that's why women sew, yet why are they not neurosurgeons? Role differentiation explains much of earnings differential between men and women, yet there seems always to be an element of power and control from those on top who are usually men.

Traditionally, the woman's role primarily has been that of nuturing her family, and even when women enter the formal labor force it is noteworthy how closely work roles correspond to home roles. Domestic service is the most obvious example, but nursing, teaching retailing ("waiting" on customers), and even employment in the textile and food industries are clearly related to "traditional" family roles. Clerical work may appear to be an exception, but most secretaries in their relation to their male bosses have a nurturant role and the label office wife, is well applied.

It is the purpose of this chapter to examine whether or not the concentration of women in service industries of one kind or another has brought about major changes in the way women are employed. In 1960 the four service sectors combined accounted for almost three-fourths of the total female labor force, and by 1970 this proportion had increased to 78 percent (see Table VI-1). In contrast, the respective values for males are 48 and 53 percent. It is of interest that as far back as 1920 the proportion of females occupied in service industries (58.5 percent) was greater than the 1970 proportionate share of males in these industries. Despite the early concentration of females in various services, these industries continued to absorb proportionately more females than did non-service industries during the 1960's. In addition, since females increased their proportion of the total labor force from 32.8 percent in 1960 to 37.6 percent in 1970, the share of services has become increasingly important. In the future, even if males and females maintained their 1970 employment shares in each industry and each sector, an increase in the proportion of the labor force that is female would bring about additional growth of service employment, due to the fact that females are more heavily concentrated in services than in the other industries. This presupposes that women will not enter the Extractive and Transformative sectors at a faster rate than they do now. If in 1970, for example, the labor force had been one-half male and one-half female, services would have accounted for 65.5 percent of total employment (provided no change in the labor force distribution of males and females) instead of the actual 62.4 percent. Thus, if in the future the proportion of women in the labor force increases even more, a close examination of the way women are now employed is quite important.

TOTAL LABOR FORCE	100.0	100.0		100.0	100.0	

The distinctive characteristic of working women is their degree of part-time work. Dual Careers (1970) points out that 78 percent of women in the labor force work full-time (over 35 hours a week) while 22 percent work part-time. Black women are more likely to work part-time than white women, mostly because blacks are more likely than whites to be in domestic services. Outside of domestic service, Black women are less likely than whites to work part-time. The amount of part-time work is important for many reasons. First, if women are the main part-time workers in a society then the effects of the characteristic "female" may be confused with the effects of the characteristic "part-time." This discussion will have more relevance later when sex-typing is introduced, but the point is that if women work part-time voluntarily (see Dual Careers, 1970), then women automatically will choose and be chosen only by those industries that have a need for part-time workers. Hewes (1962) studied women part-time workers and reported that service industries are particularly suited to the employment of part-time workers because these industries have marked fluctuations in business pressure during day or week and unusually long hours of operation. Hewes showed that only 6 percent of manufacturing and 8 percent of agricultural jobs have women in part-time work. Most women employed part-time are in service and private household (29%), wholesale and retail trade (27%), and other services like finance, real estate, entertainment, education, and welfare (26%). Therefore, sex-typing by industry is, in part, a result of the need for part-time workers.

The negative effects of part-time work is that if these married women are supplementing the family budget, this may serve to depress or dampen wage or salary scales because of their willingness to accept somewhat lower pay. Salaries and wages are further lowered by the fact that part-time work is usually characterized by high productivity (Bancroft, 1958), so the employer is getting more and paying less. Another consideration is that part-time work usually lacks on-the-job training and, as will be discussed later on, job training increases the marginal product and thus raises wages. Another negative effect is that part-time workers pose a threat to the security of full-time workers because part-time workers do not or cannot unionize to the extent of full-time workers. Last, part-time work must be examined because the effects of part-time employment might be confused with the effects of role-playing. Perhaps the desire to work part-time is a better explanation than role-playing as to why women are secretaries and saleswomen. Yet full-time female workers are also concentrated in services.

For an analysis of the female labor force, the Extractive sector has become insignificant. Mining traditionally had very few females, and agriculture did not employ more than one percent of all economically active females in 1970. Although percentage distributions do not yield information about interindustry movements per se, it can be safely assumed that the vast majority of females who were in agriculture in 1970 either had been in that industry in 1960 as well, or were new labor force entrants (see Chapter III).

Among the remaining five industry sectors, the Transformative and Personal service sectors experienced declining shares of female employment during the 1960's, the Social and Producer services sectors increased their

shares, and the Distributive services sector remained virtually unchanged (see Table VI-1). Given the concentration of females in the various sectors it comes as no surprise that proportionately less women than men are employed in Transformative industries, and this difference widened further during the last decade. The textile industry, which traditionally has employed a large proportion of females continues to be the only Transformative industry to employ relatively and absolutely more females than males. With the one exception of the machinery industry, however, the share of female employment declined in all industries of the Transformative sector during the 1960-70 period, following the same trend as that for male employment.

The discussion of the heterogeneity of services in the introductory chapter should lead us to expect that not all services are equally female oriented. In both 1960 and 1970 the Distributive services sector employed a larger share of males than of females, and two industries -- transportation and wholesale trade -- account for this difference. Transportation traditionally has been heavily male-oriented, but with the increasing bureaucratization of this industry and its new forms of technology, female employment has become more important, excepting that of vehicle operators. As a result, the share of male employment in this industry declined during the 1960's, while female employment increased. Transportation is not the only industry to experience this kind of change. Probably the most influential reason why female white-collar work has increased so greatly is the increasing paper work involved at every level of society and the employment structure. Both large and small firms need clerical workers in increasing numbers, and they do not hesitate to hire an extra secretary because the additional cost is perceived as small. Most Producer services exemplify this pattern.

Not only did specific service industries increase their proportion of total female employment, shifts also occurred on the sectoral level. In 1970, proportionately fewer females were employed in the Personal services sector than ten years earlier. This relative decline, however, was due almost exclusively to the diminishing role of domestic service, whose share of total female employment dropped from 8.3 percent in 1960 to 4.0 percent in 1970. If domestic service is excluded from the Personal services sector, almost no change in the proportion employed in this sector is observed during the 1960-70 interval (11.2 and 11.0 percent, respectively). Among Personal services, repair is the main industry that employs relatively fewer females than males. But the type of work involved in repair services such as automobile mechanics is traditionally viewed as a male occupation.

The two fastest growing sectors in terms of female employment are clearly Producer and Social services, and it is here where the differences in the proportions of males and females employed are the most pronounced. While some of the Producer services (mostly professional) do employ slightly larger share of males than of females (i.e., engineering and architectural services and legal services), the two most important industries in this sector, banking and financing services and insurance, employ a much larger proportion of females than of males. Since these two Producer services are also the most dynamic ones of this sector, the female share of employment in the Producer services sector is even larger in 1970 than it was in 1960.

By far the most important sector for the employment of females is Social services, which in 1970 accounted for almost one-third of all females in the labor force. Three of its industries alone -- medical and health services, hospitals and education -- employed over one-fourth of all females in 1970, compared with less than one-fifth in 1960. Indeed, with the exception of government, which declined slightly between 1960 and 1970, all other Social services proportionately increased their share of female employment during that period. By 1970 female employment in education for the first time exceeded that in retailing and the gain of almost four percentage points during the 1960 decade is very impressive. Although it is very doubtful that the rate at which employment in these industries has been increasing can be maintained in the present decade -- education, for example, no longer is a "growth" industry -- it nevertheless can be expected that Social services will continue for some time to absorb an increasing share of all female employment.

The concentration of females in services relative to the distribution of males can be demonstrated by comparing the proportion female of the total labor force with the female proportion of employment in each of the 37 industries. The data in Table VI-2 shows that all industries in which females account for a higher employment proportion than they do in the total labor force are service industries, the only exception being textiles. Moreover, among the industries that employ females at a proportion lower than that of the total labor force, only eight were service industries as of 1960, and this dropped to seven in 1970.

While the differences in the employment distribution among industries between males and females are quite important in themselves, they raise the question as to their implications for the occupational distribution of females and the monetary rewards of their economic activities. On the basis of the relationship covered earlier in this report between industries and occupations (see Chapter V), it is expected that females are more highly concentrated in service occupations than are males, for their employment share in service industries is also higher. Moreover, since the great majority of service industries are made up of white-collar occupations, it should be expected that females more than males are concentrated in professional, technical, clerical, and sales occupations. On the other hand, it is anticipated that relatively fewer females than males are farmers, craftswomen, operatives, laborers, and farm workers.

Occupational segregation is cited by Harriet Zellner (1972) as the cause of the earnings differential between men and women. Zellner argues that in 1968 the income of women working full-time year round was 58% of that received by men. Her data reveal that as of 1960 about 50% of all employed women were concentrated in occupations where they represented 80% or more of total employment, while only 2% of men were in such occupations. On the other hand, 20 percent of employed women were in occupations where they represented less than 33% of total employment yet nearly 90% of the employed men were in such occupations. Zellner feels that the preference for males in these masculine occupations shifts the demand curve for women to the left. Demand

TOTAL LABOR FORCE	44.7	53.3	59.2	66.0

curves, which are usually sloping, show that as the price of an item (or labor) goes down, the quantity demanded rises. Therefore a shift in a demand curve to the left for female labor means that the same quantity of labor can be bought for a lower price. This lowers female employment in masculine occupations. A female dominated sector results from a reduction in demand for women in the masculine sector, which subsequently increases their supply to those occupations in which males are not preferred to females. The results are that since demand is lower in the masculine sector, wages for women are lower, and since supply is increased in the feminine sector, wages for those women are also lower.

Francine Weisskoff (1972) agrees with Zellner's findings. She asserts that occupational segregation is as pervasive now as it was at the turn of the century. Weisskoff pointed out that well over half of all working women in both 1900 and 1960 were employed in jobs in which 70 percent or more of workers were female. She showed that the increased participation of women in the labor force has not been absorbed through an across-the-board expansion of employment opportunities but rather through a growth in traditionally female jobs or through the emergence of new occupations that rapidly became sex typed.

As an explanation of this pattern, Weisskoff explained several institutional factors that favor segregation of the sexes. The family unit with its traditional relationships between men and women socialize people into their respective roles. On the supply side girls are taught to aspire to and train for what are considered to be appropriate female occupations. Frequently, the educational system further intensifies this problem by channeling women into traditional feminine pursuits. The demand side deals with the hesitation of both workers and customers in allowing women to enter "non-feminine" occupations. Many employers are not willing to experiment with female employment in traditionally male occupations, even though new labor legislation (such as the Equal Employment Opportunity Commission's guidelines) have eliminated the most blatant discriminatory hiring practices.

Weisskoff explains the pay differentials between female and male workers in terms of supply and demand in dual labor markets. Demand is greatly restricted by the sex-typing of jobs. The supply of women available for work is highly responsive to changes in the wage rate and employment opportunities in general. Overcrowding in female occupations results in lower earnings for women's jobs.

Eliminating occupational segregation by sex is essential to any kind of economic equality for women. Weisskoff concludes that if women enter the male sector in quantity this will have the additional positive effect of raising incomes of women in predominately female occupations and will in turn attract more men to those female occupations. Nursing is a profession anxious to attract men in order to ease the shortage and to raise wages and working conditions.

On the other hand, Isabel Sawhill (1973) suggested that equal pay legislation may lower the earnings of women because it might increase the crowding in female occupations. If employers in male-dominated occupations

cannot hire women for a lower price they may not hire women at all. And, if men cannot be paid a higher price in female-dominated occupations, they might not seek those jobs, all of which would lead to further segregation. Although equal pay laws may guarantee equal wages to women working side by side with men, they tend to reduce the training opportunities available to women which is a major source of sex differential.

Sawhill used Becker's theory of human capital to explain the lower status of women and the segregation in the market place. Becker differentiates between general and on-the-job training. General training (education) is paid for by the worker, and on-the-job training is paid for by the employer. With general training, the worker pays and then collects the return on his investment. Consistent with the firm's goal of optimizing profits, presumably the firm will only pay for training where it can collect on the return. Naturally, the more on-the-job training is required the more desirous a firm is in keeping turnover low. The argument runs that women are not good training investments because of their intermittent labor force participation patterns. They are less likely to receive on-the-job training and thus be able to raise their income. Investment in training of individuals steepens the age-earnings profiles over the life cycle,but since women's participation pattern is best described by a bi-modal life-time curve, their age-earnings profiles are relatively flat. In the case of on-the-job training, the shape of age-earnings profiles depends on the extent to which employers share returns with employees in order to reduce turnover. Certain types of jobs provide a mixture of general and on-the-job training and women generally are confined to those jobs of little or no training. In other words, sex-typing occurs partly because of differences in on-the-job training which is rationalized by saying women have intermittent labor force participation. The only way for women to make up for this lack is more general training which usually comes in the form of increased education.

EDUCATIONAL ATTAINMENT

Table VI-2 shows that on the whole women have a higher proportion of the labor force in each industry with 12 years of schooling or more than do men. In 1960 53.3 percent of all employed females had twelve years of schooling or more, compared with only 44.7 percent of all employed males. This difference was reduced only minimally during the 1960's, the respective 1970 values being 66.0 and 59.2 percent.

The one sector in which the male figure is higher than females is Personal services, and domestic service, laundry and hotels account for this advantage, all three employing women with a low level of education. On the industry level, the marked advantage of males in legal and medical industries is due to the male dominance as lawyers and physicians. Turning to sectors and industries in which females have an educational advantage, we find a marked difference in the Extractive sector and in the industries of mining,

construction, utilities, transportation and repair. All of these have a low female representation and they are mainly employed in "front office" jobs as secretaries and clerks, in no way competitive with the men and their generally physical tasks. Education is the only way women can increase their earnings due to their relative lack of on-the-job training which men are more likely to receive. Therefore, for a woman to be hired she must have a higher educational attainment than a man. This condition explains why a women with a B.A. may earn the same as a man with a high school diploma.

This all contributes to the different labor force behavior of men and women. In the past, the fact that women tended to stay out of the labor force for an extended time period during childbearing ages no doubt contributed to the reluctance of employers to give women expansive on-the-job training, although this alone does not explain why women are in inferior positions as compared to men. But as we noted earlier in this chapter, recent changes in the labor force participation of women during their life cycle demonstrate that they are not leaving the labor force during childbearing ages in as great numbers as in the past. In addition, the new labor legislation such as the Equal Employment Opportunity Commission's guidelines and the Affirmative Action Program, at worst, should make discriminatory hiring practices much more difficult, and can be expected to favor increasing equality in the labor market between the sexes. Thus, while there still exists a substantial amount of inequality between the sexes (which often has become more subtle and therefore harder to detect), the nature of recent trends at least have the potential for an improvement in the employment situation of women.

OCCUPATIONAL STATUS

The preceding discussion would lead us to expect substantial differences between males and females in the types of occupations they hold, and these differences are clearly visible in Table VI-3. Even on the level of gross occupational categories, which themselves confound a great deal of internal differentiation, the distribution of females is quite different from that of males. Both in 1960 and in 1970 relatively more females than males were in white-collar occupations with the exception of managerial and semi-professional occupations. The lower share of female employment in managerial occupations is expected since a large part of these positions are in Transformative industries where females are less represented. But since many of the semi-professional occupations are found in Social services (48.8 percent of all persons in this occupational category are employed in Social services), a large share of females had been expected in semi-professional occupations.

In 1960 and 1970 females had a higher concentration in professional occupations than did males, but this difference was reduced during the 1960's This finding, however, needs further explanation. Although generally speaking, professional occupations should be considered as high-status positions, it must be noted that over one-half of all female professionals can be found in education alone. In this industry most professionals are elementary and high school teachers who rank relatively low among professional occupations. Hospitals employ the second largest proportion of female professionals and although a few are doctors, the vast majority are registered nurses. Again, the occupation of nurse ranks far lower (both in status and monetary reward) than that of doctor. Finally, medical and health services, hospitals, and

Table VI-3

PERCENTAGE DISTRIBUTION OF THE U.S. LABOR FORCE
BY MAJOR OCCUPATIONAL GROUPS AND SEX, 1960 AND 1970

Occupation	1960 Males (1)	1960 Females (2)	1960 Difference (3) =(2)-(1)	1970 Males (1)	1970 Females (2)	1970 Difference (6) =(5)-(4)
Professionals	6.7	10.4	3.7	9.2	11.8	2.6

Service workers	6.4	22.7	16.3	8.1	20.3	12.2
Laborers	7.2	0.6	-6.6	6.5	1.0	-5.5
Farm workers	2.9	1.3	-1.6	1.7	0.5	-1.2
Total Labor Force	95.9	100.0	0.1	100.0	100.1	0.1

education combined accounted for nine out of every ten female professionals in 1960, and in 1970 the proportion decreased only minimally to 88.5 percent. It thus is quite clear that although the proportion of females in professional occupations is higher than that of males, females are heavily concentrated in the two traditionally female occupations of teachers and nurses.

Blitz (1974) points out that there have been only modest improvements of the status of women in the professions. The male-dominated professions of law, medicine, architecture, and engineering have opened up slightly to women but remain over 90 percent male. Some occupations have improved greatly, such as editors and reporters where women were 1 percent in 1870 and are now 40 percent in 1970. He asserted that nurses, elementary school teachers and librarians remain female-dominated professions. The conclusion of his study was that women have done well in the professions numerically, but they are still confined to those professions of low status and pay. He further points out that managers and officials in today's society contain a larger proportion of high prestige jobs, and these occupations are virtually closed to women.

The U.S. Census showed little or no change for women in the male dominated professions between 1960 and 1970. John Parrish (1974) noted that the data in the 1970 census largely reflected decisions made prior to 1965-67 by women applicants to professional schools, so he feels that changes made since then need recognition. He points out, for example, that female enrollment in professional schools is much larger now, and that it is reasonable to expect that these women will obtain degrees in the fields of architecture, dentistry, engineering, law, medicine, optometry, pharmacy and veterinary medicine. He maintained that more change has occurred in the last few years than in the previous half century, but nevertheless he acknowledged that even doubling or tripling women's enrollment in male-dominated professions, still would leave their proportion far behind that of men.

Examining the data in Table VI-3 further, it can be seen that the main differences in the occupational distribution between males and females occur primarily among clerical workers, craftpersons, and service workers. Females are much more concentrated in clerical and service occupations while hardly any crafts-workers are female. During the 1960's, the concentration of females in clerical occupations continued, so that by 1970 more than one of every three females in the labor force was a clerical worker.

As much as clerical occupations are identified with females, crafts occupations are associated with males. Among the non-agricultural occupations only the proportion of females who are laborers is smaller than that of females who are engaged in crafts. Moreover, it is noteworthy that the proportions of males and females who are craftspersons changed very little during the decade.

Service occupations are the third major occupational group in which one sex prevails. These occupations account for the second largest proportion of female employment; throughout the 1960's about one of every five females in the labor force was in a service occupation.

While the analysis of the occupational structure is important in its own right, the main concern here is with occupational differences between males and females within industries. Since it has been shown that the occupational structure is not independent from the industry structure, the fact that females are more numerous in service industries certainly explains, at least in part, why proportionately more females than males are service workers. Given the focus of this study, the more important question is: To what extent does the occupational distribution differ by sex within detailed industries? The main objective here is to demonstrate which occupations are sex-typed among the industries. It must be noted, however, that the major occupational groups are not the most desirable categories for such an analysis. As the case of professionals demonstrated earlier, many differences between males and females exist within these major grouping. Whatever the shortcomings of these gross categories, they probably tend to understate rather than overstate the differences. Any observed differences, therefore, should be interpreted as conservative ones.

Each industry must be examined to see if there are any large differences between the number of men and women in a particular occupation. As noted earlier, clerical occupations generally show the largest difference between the percent female and the percent male. The second largest difference is usually found in the category "crafts-workers." Aside from these two occupational categories, there is no single occupational group which reveals sex-typing in all industries. In Personal services, females predominate in "service work." In the Transformative sector, operatives are more likely to be females than males, with the largest gap being 34.5 percentage points in textiles. However, the sex-typing of occupations is industry-specific, for in the chemical and utility industries operatives are 7 and 17 percentage points more males than females, respectively. In the transportation industry men comprise 30 percentage points more of operatives than women. The other industries in the Distributive services, wholesale and retail, both have large gaps between the number of men and women employed in sales. However, what is interesting is that in wholesale, the sales workers are mainly men, while in retail, which is lower paid, sales workers are mainly women.

In the Producer services sector, the occupational differences between males and females vary from one industry to the next. Banking is male-dominant in managers; insurance and real estate are male-dominant in sales workers. As to be expected, engineering, accounting, and legal services have a high concentration of males in professional occupations. In legal services, in 1970, for example, 94.5 percent of total male employment was professional, compared to only 5.3 percent for females. On the other hand, 92.5 percent of all females were in clerical positions, compared to 3.1 percent for males.

The opposite is true of Social services where in medical services, hospitals, and education women predominate as professionals because of their large proportion of nurses and teachers. Welfare has 42 percentage points more men as semi-professionals than women. And lastly, within Personal services females are dominant in the service occupations.

What must be pointed out is that even in many cases where no differences exist between male and females in terms of their occupational distribution the fact remains that individual job categories within occupations are often sex-typed. A restaurant either has waitresses or waiters, rarely both. A factory generally segregates the women operatives from the men operatives. Because of traditional practices, men and women rarely work side by side on an equal basis in equal numbers. The exceptions to this rule would be, for example, reporters and entertainers. Musicians and college professors would not be included because although women might be working side by side with men they are rarely equal in number.

The analysis of sex-typing of occupations among industries, however, must take into account the fact that the female proportion of employment varies greatly from one industry to the next. If 90 percent of employment in industry A is female, a domination of females in most occupational categories within that industry is likely. In this case it would make more sense to refer to a sex-typing of an industry rather than of an occupation. On the other hand, if in industry B females account for 25 percent of total employment yet 90 percent of all clerical workers in that industry is female, then a case could be made for the fact that clerical occupations in industry B are sex-typed. The extent of industry and occupational sex-typing will be examined in the following section.

Sex-typing of industries. If females were distributed among particular industries in the same manner as their distribution within the total labor force, then 37.6 percent of total employment in each industry should be female in 1970 (32.8 percent in 1960), according to our figures from the Public Use One Percent Samples (see Table VI-4). Obviously, this is not the case. While any decision as to what employment proportion constitutes sex-typing is arbitrary, an industry will be labeled female-dominated if females account for at least 15 percentage points more of the industry's employment than they do of the total labor force. Correspondingly, an industry is male-dominated if the female proportion of employment is 15 percentage points less than the female share of the total labor force. Thus, given that in 1960 32.8 percent of the total labor force was female, an industry is female-dominated if females account for more than 47.8 percent of industry employment, and male-oriented if females account for less than 17.8 percent of industry employment. The respective values for 1970 are 52.6 percent for the female-dominated industry and 22.6 for the male-dominated industry.

The data in Table VI-4 show the following industries to be female-dominated (in decreasing order):

Table VI-4

PERCENT FEMALE IN THE TOTAL LABOR FORCE, INDUSTRY SECTORS AND INTERMEDIATE INDUSTRY GROUPS: UNITED STATES, 1960-1970

Sectors and Industries	1960 Percent Female	1960 Rank	1970 Percent Female	1970 Rank
I. EXTRACTIVE	10.0		10.0	
1) Agriculture	10.6	33	10.5	35
2) Mining	6.2	36	7.9	36
II. TRANSFORMATIVE	27.7		23.8

37) Misc. personal serv.	38.6	16	42.9	16
TOTAL LABOR FORCE	32.8		37.6	

1960		1970	
Domestic service	54.3	Domestic service	52.5
Hospital	40.4	Hospital	39.7
Education	29.3	Medical Services	32.5
Textiles	26.8	Barber and beauty shops	30.0
Medical services	26.1	Textiles	26.2
Eating and drinking places	25.0	Education	25.2
Barber and beauty shops	22.7	Laundry & dyeing services	23.0
Laundry & dyeing services	22.0	Eating & drinking places	21.7
Banking and financing	20.3	Hotel and lodging places	21.3
Hotel and lodging places	19.1	Banking and financing	19.0
Communication	18.3	Welfare & religious services	15.1

(The numbers refer to the difference between the percent female in the total labor force and the percent female in the particular industry. In 1970, for example, 37.6 percent of the total labor force was female, yet females accounted for 90.1 percent of total employment in domestic service). With the two exceptions of communication and welfare and religious services, each the lowest ranking in 1960 and 1970, the industries that were female-dominated in 1960 remained that way in 1970. Except for textiles, all female-dominated industries are services of one kind or another, but most of them belong to the Social services and Personal services sectors. Not surprisingly, domestic service is the most female-dominated industry; females make up 90 percent of total employment. Domestic service clearly is the example that first comes to mind when talking about a female-dominated industry. Next to domestic service in terms of female-domination are hospitals; although the proportion female is lower than in domestic service, hospitals are a much more rapidly growing industry which makes the difference in the sex composition of employment more significant than that in domestic service, which has been steadily declining. Females account for about three-fourths of total hospital employment. Again, females traditionally have been employed in medical positions, and the continued employment of women as nurses and other health personnel only continues an earlier trend. Although the remaining industries listed above are quite sex-typed as well, none of them reaches the degree of female domination that characterizes domestic services or hospitals. The extent to which employed females are subject to sex-typing by industries is revealed by the fact that about one-half of all females in the labor force are employed in a female-dominated industry. The trend during the 1960's showed further that this concentration is on the increase.

The industries that are male-dominated, i.e. in which the percent female of total employment is at least 15 percentage points lower than the percent female of the total labor force, are found among all industry sectors, but most of them belong to the Extractive and the Transformative sectors. The data in Table VI-4 permit us to determine which industries are male dominated and these are listed below (in decreasing order of male domination:)

1960		1970	
Construction	-27.4	Construction	-31.6
Mining	-26.6	Mining	-29.7
Repair services	-26.1	Agriculture	-27.1
Transportation	-22.9	Repair services	-26.2
Agriculture	-22.2	Utilities	-24.4
Postal service	-19.8	Metal	-23.4
Metal	-19.4	Transportation	-23.1
Utilities	-19.2	Engineering	-21.4
Engineering	-16.8	Postal service	-17.4
		Chemical	-16.3
		Machinery	-15.2

(The number, again, refer to the difference between the percent female of the total labor force and the percent female in each particular industry). Corresponding to the case of female-dominated industries, the two most pronounced male-dominated industries can be regarded as typical male industries, namely construction and mining. Most jobs in these two industries require physical strength, are often dirty, and are somewhat hazardous, all of which are characteristics that traditionally have been ascribed to male work. Most other male-dominated industries could be similarly characterized. Among them, however, are industries where the sex-typing is much less interpretable than it might have been in the remaining industries. Consider postal service, for example. Why are females excluded from this industry, even though over 80 percent of employment is classified as clerical workers, which in every other industry is female-dominated? It is true that being a postman is not the same kind of job as sitting at a desk doing strictly clerical work, but now that nearly all mail is delivered by motor vehicle or by cart, it is not a physically demanding job.

Even if it is accepted that the nature of construction work and of the other male-dominated industries does not suit females (which one might very well choose to reject since this implies assumptions about the work capacity of women that is based more on social conventions than on biological facts), the increasing use of capital equipment in construction and in many other industries and the related trend towards the creation of operative positions should provide more job opportunities for females in male-dominated industries. As the figures in Table VI-4 and on the prior page indiate, however, the exclusion of females from male-oriented industries has increased rather than decreased.

As was previously mentioned, an interdependence exists between the industry structure and the occupational structure. Although we said earlier that logically the industry comes first in determining positions within the labor force, the occupational structure nevertheless is quite important for the analysis of the female labor force participation. On the one hand, industries "mediate" between the structure of production and the occupational labor supply, i.e. an agricultural economy requires less sales workers than would any other form of economic organization. Yet on the other hand, it is up to the employer

whom to select for what positions. While it may be that in order to perform construction tasks it is desirable to have a certain proportion of total employment as craftsworkers, this still leaves the employer with a choice as to whom he considers best qualified for those positions. Moreover, in some cases such as in education, the supply of female teachers is clearly larger than that of male teachers, and the reasons for a larger proportion of females therefore must be seen within the training context itself. For various reasons, fewer males choose education as a major field in college than do females.

If employers systematically recruit women for clerical and service occupations, and not for managerial and crafts occupations, we should then expect to find relatively fewer females in industries where crafts and managerial occupations prevail. Conversely, we would expect relatively more females in industries where clerical and service occupations dominate. For purposes of analysis, we therefore assume that the percent female in each of the eleven major occupational groups is the same in every industry as it is in the total labor force (see Table VI-5). These data clearly demonstrate that females are employed in quite different occupations than males, as was pointed out in the previous section. Although in 1970 females accounted for only 37.6 percent of the total labor force, about three-fourths of all clerical workers are females. On the other hand, females are virtually excluded from crafts occupations. By assuming no differences in occupational sex-typing among industries, we can examine the extent to which some industries are more sex-typed than others.

Following this assumption, the expected percent female in each industry can be computed by taking the inter-industry differences in the occupational structure into account. The following formula is used for that computation:

$$\hat{PF}_i = \sum_{d=1}^{11} (PF_j \times N_{ji} / 100) / (N_i)$$

where $\hat{PF}_i$ is the expected percent female in the ith industry, PF_j is the percent female in the jth occupation of the total labor force, N_{ji} is the total number of persons in the jth occupation within the ith industry, and N_i is the total employment in the ith industry. Illustratively, the data in Table VI-6 show that in 1970 38.0 percent of all salesworkers were females. Since there were 28,638 salesworkers in retail trade (according to the 1/100 Public Use Sample) we would expect 28,638 x .38 = 10,882 females to be sales workers in retail trade. Summing these expected values for all eleven occupations in retail trade gives us the expected number of females in that industry. Dividing this sum by the total number of persons employed in retail trade gives us the expected percent female. A comparison of the expected with the actual percent female permits us to assess the extent to which sex-typing of females varies among industries. If the difference is greater than an absolute value of 10 percent, the industry is considered to be sex-typed. Female-dominated

Table VI-5

PERCENT FEMALE IN MAJOR OCCUPATIONAL GROUPS:
UNITED STATES, 1960-1970

Occupation	1960	1970
Professionals	42.2	43.5
Semi-professionals	29.4	32.6
Farmers	4.6	4.4
Managers	14.6	16.6
Clerical workers	67.4	73.5
Sales workers	35.7	38.0
Craftspersons	2.8	4.9
Operatives	27.3	30.9
Service workers	62.9	60.2
Laborers	3.6	8.4
Farm workers	17.6	14.8
Total Labor Force	32.8	37.6

is the term applied to those industries with a positive difference of more than 10 percentage points, and male-dominated is applied to those industries with a negative difference of more than 10 percentage points.

The 1960 data in Table VI-6 indicate the following industries to be sex-typed:

1960

female dominated		male dominated	
Domestic	33.1	Postal	-44.5
Textiles	31.2	Engineering	-20.8
Hospitals	26.9	Mining	-18.3
Laundry	26.2	Transportation	-16.9
Medical	23.7	Accounting	-15.7
Education	19.5	Utilities	-13.1
Communication	11.4	Wholesale	-10.7
Misc. personal ser.	11.4	Government	-10.1
		Chemicals	-10.1

1970

female dominated		male dominated	
Domestic	33.6	Postal	-44.7
Textiles	32.5	Engineering	-24.6
Laundry	30.3	Transportation	-22.7
Hospitals	26.1	Mining	-20.2
Medical	18.5	Utilities	-14.6
Education	15.2	Wholesale	-13.2
		Real Estate	-12.5
		Chemicals	-12.3
		Accounting	-11.8
		Government	-11.0

In 1960 there are eight female dominated and nine male dominated industries. For the most part these are the same industries that were classified in Table VI-4 as sex-typed without taking the occupational structure into account. Table VI-6 is a measurement of the industry effect on sex-typing, whereas Table VI-4 measurement of the combined effects of occupation and industry on sex-typing. The difference between the actual and expected number of females shows how much industry itself contributes to sex-typing. The smaller the difference, the less sex-typed the industry is. If the difference is positive then there are more females than would be expected, and if the difference is negative, there are fewer females than expected.

Comparing Tables VI-6 and VI-4 in terms of female-dominated industries in 1960, it can be seen that miscellaneous personal services have a higher proportion of female employment than was expected, whereas eating and drinking places, barber and beauty shops, banking and financing, and hotels and lodging places do not employ more females than should have been expected on the basis of their occupational structure. Thus, given the fact that females are

Table VI-6

EXPECTED AND ACTUAL PROPORTION FEMALE BY SECTORS, AND INDUSTRIES
1960-1970

Sectors and Industries	1960 Expected	1960 Actual	1960 Difference	1970 Expected	1970 Actual	1970 Difference

34) Laundry	29.6	54.8	26.2	36.3	66.6	30.3
35) Barber & beauty shop	58.2	55.5	-2.7	60.0	67.6	7.6
36) Entertainment	37.3	32.3	-5.0	41.6	35.1	-6.5
37) Misc. personal serv.	28.2	39.6	11.4	33.5	42.9	9.4

overrepresented in service occupations, their shares of employment in the latter three Personal services was within the expected range. Similarly, as clerical work accounts for a large proportion of employment in banking and financing, and as clerical occupations are clearly female-oriented, the employment share of females in banking and financing was to be expected as well.

Concerning males, the differences between industries in Tables VI-4 and VI-6 are somewhat larger. Construction, agriculture, repair services, and metal industries are not listed as male-dominated industries in Table VI-6, but they appear in Table VI-4. Given the occupational structure of these industries, women are represented in the expected number, which is low. Industries like postal services, engineering, mining, and transportation are classified as sex-typed in both tables. Accounting, utilities, wholesale, government and chemical industries are added to Table VI-6. Given the occupational structure of these industries, women are underrepresented.

In 1970 the only changes in Table VI-6 for female dominated industries are that miscellaneous personal services and communication are not present, and real estate is added as a male-oriented industry. These changes are reflective of the fact that during the 1960-70 period the differences between the expected and the actual employment of females in female-oriented industries declined, whereas the differences generally widened for male-oriented industries. The exceptions are: accounting, which was male-dominated both in 1960 and 1970 but less so in 1970; welfare, which was female-dominated in 1960 and 1970 but more so in 1970; and various Personal services (domestic service, hotel and lodging places, laundry services, and barber and beauty shops) which became more female-oriented in 1970. Aside from these industries all other industries either became less female-oriented or more male-oriented. The reasons for this lies partially in the fact that as a result of the increasing labor force participation of women between 1960 and 1970 women gained proportionately in every occupational category except for service work and farm work (see Table VI-5). These gains raised the expected share of female employment in each industry (Table VI-6) and therefore lowered the difference between the expected and the actual employment as far as female-dominated industries are concerned. What is significant is the fact that in those industries where females already were underrepresented in 1960, the employment changes during the 1960-70 period further widened the gap between the number of women expected and the actual number of women.

While industries in which the actual percent female differed from the expected percent female by no more than ten percentage points were not considered to be sex-typed, this may have been the result of the fact that in some occupations within a particular industry, females made up a significantly larger proportion of employment than would have been expected, but that this overrepresentation was cancelled out by the effects of female underrepresentation in other occupations within that same industry. This possibility is examined in the following section.

The best example of this phenomenon is legal services. The difference between the actual and the expected in the legal industry is -9.2 in 1960,

and -9.9 in 1970. But women comprise 92 percent and 93 percent in 1960 and 1970, respectively, of clerical workers in this industry, whereas men account for 93 percent and 95 percent in 1960 and 1970, respectively, of professionals in this industry. This is the most extreme case of sex-typing which is not evident in Table VI-6 because the overrepresentation of women in clerical work and their underrepresentation in professional positions cancelled each other out. This also occurred in insurance, which has an underrepresentation of clerical workers and an overrepresentation of male sales workers.

Table VI-6 sorts out the industry sex-typing from the occupational sex-typing. Occupational sex-typing is less easy to correct because men and women still have occupational roles that they fall into and train for. Industry sex-typing should be easier to eradicate, because it only involves shifting already trained personnel to different industries.

The growing domination of services has the potential of affecting women more than any other group of the labor force. One of the prime characteristics of a "service economy" is the move away from physical work, which is illustrated by the increase of white-collar jobs. Yet women are not equally distributed in the labor force even in white collar jobs due to role differentiation and their intermittent labor force participation patterns that limits human capital investments, especially over the length of the work life cycle. If one assumes that at birth the mental capabilities of men and women are equal, then it is only role prejudice (which also accounts for the bi-model participation curve) that prevents an equal distribution of men and women in most jobs, occupations, industries, and sectors. Role prejudice occurs when there are genetic differences in the population which are visible but not necessarily significant for role performance. Kenneth E. Boulding (1973: 252) addressed this question in a beautiful analogy of the genetic differences between blood types and the genetic differences between sexes. He stated,

> In ordinary life we are quite unaware of a person's blood type. Consequently, it can be safely assumed that there are no role prejudices against blood types of different kinds unless these happen to be associated with other characteristics which are socially visible. For the major types, this association is fairly minimal. Consequently, we would be very surprised to find a distribution of blood types in any occupational group or income group of any size which is markedly different from the distribution of blood types in the population as a whole.
>
> The genetic division of the human race into men and women qualifies in most societies as the major form both of discrimination in the existing labor force and of role prejudice. This is not surprising as the genetic difference between sexes is far greater than it is among races in terms of the structure of information of the genetic

> code. There is one role indeed - that of bearing children - in which there is 100 percent genetic specialization between the sexes, in the sense that no men will be found in the childbearing population. The very social visibility of the distinction between the sexes, however, makes it a prime candidate for role prejudice which creates a huge reservoir of false knowledge, false education, and false learnings processes ...

In the past, the physical requirements of work, concommitant with the sex-role differentiation, has often been cited as contributing to the division of labor by sex. In a service society, however, work by and large has lost most of its physical characteristics. (This is not to say that work is no longer strenuous; certainly, eight hours at a typewriter does result in physical exhaustion. But this stress derives from factors other than the physical requirements of pressing down typewriter keys.) In that sense, the service society provides at least the opportunity for men and women to work in comparable positions. The remaining division of labor by sex in a service society, therefore, must largely be examined within the framework of sex-role differences.

Chapter VII

THE SECTOR AND INDUSTRY POSITION OF MINORITIES

As is the case with sexual differences, throughout this report there has been presented data on the sectoral and industry changes of blacks, but the references have been in passing, so to speak. In this chapter attention will be focused on the blacks and their position vis-à-vis the whites. To a lesser extent the Mexican-American population of the Southwest will be considered, it representing the second largest minority in the U.S.A. The contrast between the two minorities is instructive, for while they both are much below the whites on socioeconomic criteria, they demonstrate some important differences, e.g., the problem of language for the Mexican-Americans. First, however, we turn our attention to black-white differences.

BLACKS IN THE LABOR FORCE

After the early emphasis in black studies on the family structure [e.g., DuBois, 1970(1909); Frazier, 1939], Myrdal's An American Dilemma set the stage for investigations dealing with a wide range of social and economic characteristics of the black population (Pettigrew, 1964; Glenn, 1969; Price, 1969). Most of these studies noted that blacks had gained in many respects, be it income, education, or occupational status. As pointed out by Glenn (1969), however, much of this progress was rather moderate and did not serve to reduce much of the gap existing between whites and blacks in these characteristics. Furthermore, in some respects the status of blacks relative to whites even declined. The ratio of nonwhite to white infant mortality (age one month to one year), for example, increased from 2.30 in 1950 to 2.76 in 1965 (Glenn, 1969:52). It thus is the consensus of most of the literature about blacks that the post-war changes did improve the socioeconomic position of blacks, but that these improvements did not substantially narrow the difference between whites and blacks along these dimensions.

The various civil rights legislation during the 1960's raised expectations that at last the relative position of blacks would improve to the point where the differences between whites and blacks would be substantially reduced. In a recent assessment of these changes Farley and Hermalin (1972) asked the question whether or not the 1960's had been a decade of progress for blacks. They concluded that the last decade did indeed improve the position of blacks: their incidence of poverty was lower in 1970 than in 1960, they had higher educational attainment and occupied better positions in the labor force. But they also noted substantial differences between various groups of blacks. The socioeconomic improvement was better for younger than for older blacks and females did much better than males relative to whites. On the other hand, Farley and Hermalin pointed out that blacks are still behind the status of whites. Even in 1970, for example, only 13 percent of all black males were employed in professional and managerial occupations, compared to 23 percent of white males in 1960, ten years earlier. Similar though slightly smaller differences can be observed for white and black females (Farley and Hermalin, 1972: 363). Again, young blacks did much better than older ones in regard to occupational status. In sum, although the improvements of blacks, particularly of black females, are clearly visible, they have not been achieved uniformly for all blacks.

One reflection of improving social conditions is educational attainment, and this of course will affect young people more than old people. In that sense, young

minority members can be expected to fare relatively better than the older generations. As was recently pointed out by Poston et al., (forthcoming), however, there is a possibility that the relatively better position of the younger members of minorities worsens as they grow older. The reason for this is that whites are more likely to be in positions that are in career lines than minorities. In other words, while whites and minorities might start out at similar levels (although not even that situation exists as yet), the career advancement of young whites is more rapid than those of young blacks or Mexican-Americans. Thus, only through longitudinal studies can it be shown whether or not the apparent favorable positions of young blacks can be maintained over time.

It is the purpose of this chapter to shed additional light on the position of blacks in the labor force by concentrating on their distribution among industries. Consistent with the emphasis throughout this study on the relationship between the sectoral transformation of the labor force and various employment characteristics, this part of the study addresses the question of whether or not the position of blacks relative to whites has been affected by changes in the industry structure and what, if any, differences exist between industries with respect to the employment of blacks.

Before entering that analysis, a further differentiation must be made. The findings of the preceding chapter pointed to rather remarkable differences between males and females in the way they are employed in different industries. It was shown, for example, that females are much more heavily concentrated in service industries than males. In addition, females maintain quite different occupations. As black females have a much higher labor force participation rate than white females (the percent female among the black labor force was 45.1 percent in 1970 as compared to 37.0 percent for the white labor force), the different female labor force rates are likely to account for part of the differences in the employment patterns of blacks and whites. A comparison of them therefore must consider differentiation by sex. For these reasons the following analyses will be carried out for males and females separately.

Industry Position

Males. Table VII-1 indicates important differences in the sector and industry distribution of black and white males, particularly in the Producer and Personal services among sectors, and agriculture, machinery, and domestic service among industries for the 1960 period. However, what is most striking in Table VII-1 is the convergence indicated for the 1960-1970 period. Among the six sectors, only Social services showed a slight widening; the other five demonstrated convergence. The industries show more variation, but in nearly every case where there is a widening, it is the black proportion of total labor force that is greater than the white. This general convergence in the industry distribution of employment largely has been the result of changes in the industry allocation of black males, for the white distribution, except for the Extractive and Social services sector, is little changes throughout the decade.

TOTAL LABOR FORCE	99.8	100.0	99.8	99.3

Part of the change in the distribution of black males by industry during the 1960's is related to their increased urbanization. In 1960, 72.4 percent of the nonwhite population was urban and this increased to 81.3 percent in 1970. (Although "nonwhite" is not identical with "black", blacks account for over 85 percent of all nonwhites). As a consequence of this trend, their share of employment in agriculture declined by over 55 percent during the 1960-70 period. By 1970 agriculture, therefore, ceased to be an important industry for the employment of black males.

As is the case for the total labor force, mining in the recent past has not accounted for much employment among black males, but it is interesting to note that although the proportion of white males in this industry has steadily declined during the last 50 years, the proportion of black males in mining has slightly increased during the 1960's. It might well be that this situation results from the fact that blacks in mining were greatly underrepresented in the past. Thus the current trend could be interpreted to indicate a more similar employment pattern of white and black males in this industry.

The other industry sector in which the share of employment for black males declined during the 1960's are Personal services. This decline is the more remarkable as all Personal services shared in the proportionate decline. In contrast, white employment in this sector increased as much as the total white male labor force; as a result, their share in Personal services remained stable during the last decade.

It is primarily the decline of the proportionate employment of black males in the Extractive and the Personal services sectors which made the industry composition of black employment more similar to that of white males.

The third major change in the industry composition of black males was the expansion of employment in Transformative industries. Although proportionate employment of black males did decline in construction and food industries, the gains in the remaining industries in their sector more than offset those declines. Particularly noteworthy is the increase of blacks in machinery industries, which include transportation equipment. These industries, especially the automobile industry, have a relatively high wage scale which makes the expansion of black employment in this industry even more significant. The increases in the share of employment in Transformative industries for black males is particularly noteworthy in light of the fact that employment of white males in these industries, especially in food and textiles, declined. As a result, black males for the first time in 1970 were relatively more numerous in the Transformative sector than were white males. Given the overall trend of the labor force to move toward service industries, however, it can be expected that the proportion of black males in Transformative industries will not increase much more.

The remaining three industry sectors--Distributive, Producer, and Social services--are characterized by similar employment trends of black and white males during the 1960-70 decade.

Black males are employed in relatively smaller proportions in Distributive services than white males, and the difference between the shares of employment for black and white males has not changed much during the 1960's. Particularly noteworthy is the low proportion of black males in retailing, as compared to white males. Throughout the 1960's, the share of black males in this industry was three percentage points (or about one-fourth) lower than the corresponding share for white males. This finding seems puzzling. If we assume that due to lower educational attainment, black males are more likely to be found in industries that require relatively few skills and provide low wages, a relatively large share of blacks should have been expected in retailing, for the skill requirements in this industry are lower than in many Transformative industries. Thus, the underrepresentation of black males in retailing is unexpected. But it is possible to argue that although most jobs in retailing are relatively low-status positions, employers might not prefer blacks because of the direct face-to-face contact with the customer that is required in this industry. And in those places where both races are hired there is a division of labor. In restaurants and cafeterias, for example, blacks are much more likely to work in the kitchen and clearing tables, whereas whites are more likely to be taking orders and serving. The same pattern will be encountered for black females, lending support to the argument that discrimination is an important factor.

The industry sector from which black males are still excluded to a large extent is Producer services. Although for the entire sector the difference between white and black males in the respective shares of employment was only 2.9 percentage points in 1970 (down 0.3 percentage points from 1960), this difference is quite significant given the small size of this sector. In other words, the proportion of all black males in the Producer services sector was 38 percent smaller than the white share in 1970. This underrepresentation of black males is the more remarkable as it concerns all Producer services, except real estate. Although the data in Table VII-1 show that blacks did make relative gains in this sector during the 1960's their relative proportion in engineering and architectural services, accounting and bookkeeping, and legal services still is only one-fourth or less the proportion of whites in 1970.

The situation in the Producer services sector, however, is interesting in many respects. Although even in 1970 relatively few black males are employed in this sector, they doubled their proportion in banking and miscellaneous business services during the 1960's. It seems reasonable to assume that part of these changes are indeed due to legislation such as the Equal Opportunity Employment Act. Furthermore, and perhaps even more important, many banks and advertising agencies discovered the consumption potential of blacks during the 1960's and therefore were eager to employ blacks--if only on a token basis--in order to gain entry into this market. Engineering and legal services, on the other hand, due to their high proportion of professionals, were less likely to increase their proportion of black employment, for this is partly dependent upon a concomittant increase of blacks in professional education, such as law schools and science departments. As blacks have entered these fields in larger numbers during the recent years, they should account for a much larger share of employment in these services in 1980.

Finally, black males continued to have a larger share of employment in Social services than white males during the 1960-70 period. But this difference is somewhat misleading as it results from just two industries: hospitals and postal services. The occupational status gap is much greater for hospitals, where blacks generally have menial tasks, as compared to postal services, where there is not so great a social differentiation. With the only exception of medical services, in which blacks are less represented than whites (for similar reasons as in the case of Producer services), the other Social services show a remarkable similarity in terms of their shares of employment of black and white males.

Females. In contrast to the increasing similarity of industry composition of white and black male employment, much greater variation still exists between white females and black females (see Table VII-2). In 1960 this was largely due to the enormously high proportion of black women in Personal services. At that time this one sector accounted for over one-half of all black females in the labor force! In comparison, only 15.2 percent of white females worked in this sector. Most of the differences were accounted for by domestic service which employed over one-third (37.5 percent) of all black females, in contrast to only 4.3 percent of white females. Indeed, if this industry is excluded from the Personal services sector, the difference in the relative proportions of black and white employment is very small. Despite this large concentration of black females in domestic service, their share of employment in Social services for 1960 was not much smaller than the corresponding proportion for white females in this sector. Within Social services, black females were most underrepresented in education. Another interesting difference is that white women proportionately were more numerous than blacks in medical services, while the reverse was true in hospitals. Since medical services are mostly private whereas hospitals are usually public (or at least non-profit), it appears that black females find it easier to get employment in larger bureaucracies than in the smaller offices of private physicians or dentists. Furthermore, as in large organizations such as hospitals, a substantial part of employment involves low-status occupations such as orderlies, nurses' aides, and cleaning personnel, all of which largely have been occupied by blacks in the past. Thus, the difference between medical services and hospitals in terms of white and black female employment is not all that surprising.

With the exception of the Extractive sector where the share of employment of black females is somewhat larger than the corresponding share for white females (although this sector is so small that it does not account for much of the difference in the industry composition of black and white employment), great differences exist in the remaining sectors. In the Transformative sector in 1960, the ratio of the share of employment of white females to the share of black females was two; it was three in Distributive services and four in Producer services. In these three sectors, no individual industry showed a smaller relative proportion for white females than for black females, with the sole exception of real estate. The differences are particularly noteworthy in Producer services: proportionately the total sector employed four times as many white females as black females, but banking and financing accounted for ten times as many whites as blacks, and legal services six times as many. This discrepancy is probably the most remarkable one, as most of these services are industries whose employment expanded only relatively recently.

36) Entertainment	0.8	0.5	0.8	0.5
37) Misc. personal serv.	0.4	0.4	0.3	0.3
TOTAL LABOR FORCE	99.8	100.0	99.8	99.9

During the 1960's, however, the distribution of the black female labor force by industries changed drastically. As a result, the differences between white and black females became much reduced, although they still are larger than the differences between white and black males. In just ten years the share of employment of black females in domestic service decreased from 37.5 percent to 17.7 percent. While this proportion is still much higher than the respective white share, a decline of such magnitude in so short a time as one decade is quite remarkable. Moreover, if domestic service is excluded from the Personal services sector, almost equal shares of black and white females work in these industries.

Of all industry sectors, Social services experienced the largest employment expansion of black females during the 1960's. In 1970 white females still had a higher share in medical and educational services than did black females, but the difference has become almost negligible. Furthermore, although domestic services accounted for the largest individual share of the black female labor force in 1970, the shares of employment in hospitals and education have come very close to it. As was already earlier observed for males, postal services increasingly seem to attract black females. Combining the employment in hospitals, education, postal, and government services, it can be seen from Table VI-2 that the public sector accounts for 31 percent of total employment of black females in contrast to 19 percent in 1960.

By 1970 the employment in the Extractive sector had reached such a small proportion of the total labor force for both black and white females that it had lost any impact on the industry distribution of the labor force. It is noteworthy, however, that during the 1960's the shares of employment of white and black females in the Transformative sector have become much more similar, due to the fact that the proportionate employment in these industries increased for black females, while it decreased for white females. In 1970 the main differences between the two labor force groups were in construction, metal, machinery, and miscellaneous manufacturing industries, in which black females were relatively underrepresented.

In contrast to the relative convergence of the employment shares in Extractive and Transformative sectors and Social and Personal services, the difference between black and white females in Distributive and Producer services were largely maintained during the 1960's. Retail trade deserves particular attention because white females are more than twice as important as blacks in proportionate terms. Again, this small proportion of black females appears difficult to explain, and the same factors seem to be at work as was the previously discussed case for males.

Despite the fact that the share of employment of white females in Producer services was twice that of black females, there are indications to suggest that the gap is decreasing. Consider banking and financing, for example. In 1960 only 0.3 percent of all black females were employed in this industry, yet by 1970 this share increased to 1.6 percent. Thus black females made even faster gains in this industry than black males. Part of this expansion is undoubtedly due to efforts of financial institutions to gain part of the consumer market of blacks.

The discussion of the labor force trends during the 1960's for blacks and whites reveals that the differences in the employment distribution by industry has greatly diminished, i.e., the proportions of the labor force of whites and blacks in the selected industries have become more similar in 1970 than they were in 1960. This finding holds for males as well as females. The pattern is clearly demonstrated by the data in Table VII-3 which refer to the index of dissimilarity between the employment distributions by sex of blacks and whites. While in 1960 15.9 percent of either the white or black male labor force would have had to be re-distributed in order to achieve equal distributions of the two labor force groups among industries, this would have required a shift of 11.6 percent in 1970. The convergence is much more striking for females where the proportion that would have to be redistributed declined from 41.9 percent to 15.6 percent between 1960 and 1970. This drastic decrease primarily is the result of the declining share of employment of black females in domestic service, but it must be noted that Personal services in general employed lower proportions of black females in 1970 than they did in 1960. These data indeed signify a very important trend for the employment of black females. While in 1960 the majority of black females was employed in the traditional position of servant (in its various manifestations), the major part of employment of black females lost this characteristic during the 1960's. Much employment in the Social services, and particularly in hospitals where it is a similar type of work as that of a nanny, still fits the traditional employment pattern of black females, except in a more bureaucratic setting. But this is not the case for many other positions. And even where the change in employment has meant less a change in the type of work, the fact that the same work is carried on in a different organizational context is an important consideration. Being a maid in a household and a janitress in a hospital implies similar work, but in the latter case it has lost its character of being a service oriented towards individual consumption. And importantly, the latter provides opportunities for organization to press for higher wages and better working conditions that are not open to the former. In that sense, the change in the employment of black females during the 1960's is very important indeed.

Education

Educational requirements differ greatly by industry. Employment in eating and drinking places, for example, requires less education than does work in medical services. This is not to deny the fact that the task of a janitor in a clinic is less skilled than that of a manager in a restaurant, but if all positions in an industry are combined, medical services require more skills than eating and drinking places. These differences in educational requirements are likely to be reflected in the educational attainment of persons in the labor force. Thus, the educational attainment of persons employed in medical services is likely to be higher than that of persons employed in eating and drinking places.

The data in Tables VII-4 and VII-5 clearly reflect these differences. Persons in Social and Producer services have more education than those employed in the remaining industry sectors; this holds for males and females, and for blacks and whites. (Twelve years of schooling or more was chosen as a measure for educational attainment since the completion of high school is a major requirement for many

Table VII-3

INDEX OF DISSIMILARITY BETWEEN THE INDUSTRY DISTRIBUTIONS OF BLACK AND WHITE MALES AND BLACK AND WHITE FEMALES BY INDUSTRY SECTORS: UNITED STATES, 1960-1970

Industry Sectors	Males		Females

positions in the labor market. To that extent, the difference between persons who have 12 years of education and those with only 11 years is much greater than the difference between 11 years and 10 years of education.) At the one extreme, persons employed in Personal services and agriculture have the lowest educational attainment. In 1960, however, black males in Personal services had more schooling than black males in either the Transformative, Distributive, or Extractive sectors, which suggests that ten years ago blacks in these industries were employed in different positions than in 1970. Particularly remarkable is the low educational attainment of blacks in agriculture, which even in 1970 is below that of domestic service. Although whites in agriculture, too, have low educational attainment, it nevertheless is much closer to that of other industries.

In addition to the fact that educational attainment differs by industry, the data in Table VII-6 reveal that these differences are not the same for whites and blacks. For example, taking males, it can be seen that in 1960 the share of all blacks who completed at least 12 years of schooling was 45.8 percent of the share of whites, while proportionately as many blacks as whites employed in barber and beauty shops completed 12 years of schooling (Table VII-6, Col. 1). In both 1960 and 1970 educational attainment of black males in relation to that of white males generally was higher in Social and Producer services than in other industries. Of the 19 industries in 1970, for example, in which the proportion of black males with 12 years of schooling or more was at least two-thirds that of white males, 12 were to be found in Producer and Social services.

A comparison of Tables VII-4 and VII-5 shows that in absolute terms black females have more schooling than black males. Inspecting the data in Table VII-6 it can be seen, in addition, that the amount of educational attainment of black females in relation to that of white females compares more favorably than in the case of white and black males. By 1970, only six industries (agriculture, real estate, domestic service, hotel and lodging places, repair services, and miscellaneous personal services) showed the proportion of black females with 12 years of schooling or more to be less than two-thirds the proportion of white females with the same education. Moreover, there were four industries (textiles, engineering and architectural services, accounting and bookkeeping services, and postal services) in which proportionately more black females than white females had completed at least 12 years of schooling. (It should be noted, however, that the number of black females in engineering, architectural, accounting and bookkeeping services was so small that these results could be due to sampling errors.)

Comparing the change in educational attainment from 1960 to 1970, the data in Table VII-6 clearly reveal that blacks had larger increases than whites. In 1960 proportionately less than one-half as many black as white males had 12 years of schooling or more, increasing to almost two-thirds in 1970. For black females, the proportion increased from slightly over one-half to more than two-thirds.

This relative increase in educational attainment of black males and females can be observed in the vast majority of industries. It is primarily in Personal services where whites have made more rapid educational gains than blacks. The

reasons for this are not all that clear, but it is interesting to note that in most of these industries proportionately much less blacks were employed in 1970 than in 1960. It could well be that the age structure of blacks in these industries has changed, such that in 1970 more older people were employed there. Since new labor force cohorts usually have higher educational attainment than the previous cohorts, the absence of new black labor force entries into the Personal services sector might have reduced the amount of schooling in these industries in relation to that of whites.

In the same vein, many of the gains in educational attainment of blacks in the other industries are most likely to be due to the better schooling of the younger labor force cohorts. As was pointed out earlier in this chapter, the majority of the consequences of the various civil rights legislation passed during the 1960's will benefit the younger members of minorities the most, as they can benefit from increasing educational opportunities. While the amount of these opportunities should not be overestimated--there still exists too much inequality in the school system primarily based on racial differences--it nevertheless can be expected that new labor force entries have higher educational attainment than their predecessors.

The preceding discussion of education may leave the reader with an incomplete impression of the relationship between education and the allocation of employment to jobs. To repeat, industries certainly differ in their educational requirements. Relatively less education, for example, is needed to perform domestic work than is the case with legal services. Relating these requirements to the fact that the median educational attainment of blacks is lower than that of whites, one might wish to conclude that it is largely education that determines the allocation of blacks to industries. As the comparison between males and females in the previous chapter demonstrates, however, education plays only a minor part in the allocation of females to positions. To be sure, it can be expected that those members of the labor force whose educational attainment is low are more likely to be employed in industries with few skill requirements. The point to be made here, however, is that for the majority of positions in the labor force blacks do have the "necessary" education. As was pointed out by Fogel (1967), education often is used rather as a selection criterion in the hiring process and it bears scant relationship to the skill needs of a particular work position. Furthermore, as on-the-job training becomes more and more important for productivity, the argument that it is because of lack of educational attainment that blacks are in different industries increasingly has lost its plausibility (if it ever had any). Thus, even a narrowing of the gap between black and white educational attainment will not necessarily reduce the differences in the allocation of these labor force groups to certain positions.

Bergmann and Lyle (1971) in their analysis of occupational status differentials between blacks and whites provide further evidence for this line of reasoning. As they put it (1971:433):

> "Explanations of the differences in Negro occupational standing among metropolitan areas or among industries which run in terms of differences

in circumstances having little or nothing to do with employment discrimination are not supported by our results. Variables bearing on the quantity and quality of education do not help in predicting Negro occupational standing by area."

Instead, Bergmann and Lyle found the sentiment towards blacks in communities to be one of the most powerful variables to explain black-white differences in occupational status. This finding does not imply that educational attainment should not improve the position of blacks, but it "may change the pecking order among the Negro community more than it changes the overall status of the Negro community relative to the white community" (Bergmann and Lyle, 1971:433). One of the most distressing findings in their study was the fact that industries with a high involvement in Federal government contracts are characterized by large occupational status differentials between blacks and whites (1971:431). If this pattern prevails, it will further curb the chances of minority members to achieve equal participation in the labor market.

Given the existence of many other factors that make for an unequal competition in the labor force between blacks and whites, the fact that educational attainment of the two population groups still differs significantly should lead us to the expectation that these differences will be strongly reflected in the occupational distribution of whites and blacks. The following section addresses this aspect of the differences in white and black employment.

Occupational Status

Males. The data in Table VII-7 show that the occupational differences between black and white males was largely maintained during the last decade. The proportions of employment of black males were smaller than the corresponding white proportions in all major occupational groups, from craftsmen to professionals (the only exception occurred in 1970 when proportionately slightly more blacks than whites were clerical workers). Blacks quite clearly are concentrated in the low-status occupations: operatives, service workers, laborers, and farm workers. In 1970 these occupational groups accounted for 64.5 percent of all black males in the labor force, as compared with 32.1 percent of all white males (the respective figures for 1960 are 72.8 and 33.6 percent).

These data indicate that the proportion of blacks in low-status occupations decreased faster than did that of whites and, as a result, occupational differentiation by race also decreased slightly from 1960 to 1970 (the index of dissimilarity in 1970 was 33.5 compared with 39.1 in 1960). But it must also be noted that white males continue to hold better occupations than do blacks. In 1970, for example, proportionately three times as many blacks as whites were in low-status occupations. Whatever progress black males have made in occupational terms, the discrepancies between white and black males are still very pronounced.

It repeatedly has been noted in this study that the industry structure and the occupational structure are by no means independent of each other. Since it was pointed out earlier that blacks are in different industries than whites, some occupational differences could have been expected. While it is instructive to point out

Table VII-7

PERCENTAGE DISTRIBUTION OF THE MALE LABOR FORCE BY MAJOR OCCUPATIONAL GROUPS AND ETHNIC STATUS: UNITED STATES, 1960-1970

Occupation	1960			1970

TOTALS	100.0	100.2		100.0	100.2	

the occupational consequences of the different industry distributions of whites and blacks in the labor force (as seen in Table VII-7), it is equally important to examine the extent to which blacks and whites maintain different occupations in the same industry.

The low-status occupations (operatives, service workers, laborers, and farm workers) account for the smallest proportions of both white and black employment in Social and Producer services, while their shares of employment in Personal services and agriculture is much higher (see Table VII-8). Thus it can be observed that the proportion of blacks and whites in low-status occupations in general depends upon the occupational requirements of the various industries. But besides these "functional" differences among industries, additional differences exist in terms of ethnic status, i.e., some industries are characterized by a large concentration of blacks in low-status occupations in relation to the percentage of whites. Thus, although for the total labor force the proportion of blacks in low-status occupations is about twice as high as that of whites, it is at least three times as high in construction, utilities, communication, banking, real estate, engineering, and medical services. These industries must therefore be considered as particularly unfavorable for the employment of blacks in higher-status occupations.

As far as the 1960-70 changes are concerned, it can be noted that the overall decline of blacks in low-status occupations was due more to their changing employment distribution among industries than to occupational improvements within industries. That is, the proportion of white and black males in low-status occupations changed quite similarly during the 1960's. For example, consider the textile industry: its total employment--whites as well as blacks--is increasingly concentrated in the lower-status occupations, primarily as operatives. Both whites and blacks thus are subject to the different employment needs arising from technological and organizational changes.

Females. The finding that blacks staff the low-status positions in the labor force is as valid for females as for males (see Table VII-9). But whereas black males are primarily operatives, black females are mostly service workers. This was very pronounced as recently as 1960 when 62.4 percent of all black females in the labor force were service workers. In contrast, only 17.4 percent of all employed white females were in service occupations at that time. On the other hand, while most white females are clerical workers, this occupation accounted for only 8.1 percent of black females in 1960. As black females strongly left Personal services during the 1960's, proportionately fewer black females were service workers (Table VII-9). But even in 1970 the most important differences in the occupational distribution between whites and blacks still involved service occupations in which blacks predominate, and clerical occupations where Anglos are concentrated. The employment proportions of blacks and whites in the other occupational groups remained fairly stable in relation to each other. In 1960, for example, the share of white females that were professional was 4.7 percentage points higher than that of blacks, while this difference was 4.1 percentage points in 1970. Besides service and clerical occupations, only the proportions in operatives showed more changes during the last decade. Apparently as a consequence of the growing share of black females in Transformative industries, proportionately more females were operatives in 1970 than in

1960. Correspondingly, the employment share of white females in operative occupations declined as whites moved out of the Transformative sector.

While the decline of the employment share of black females in low-status occupations from 80.2 to 61.9 percent suggests improved conditions for the employment of blacks, it must again be examined--as in the case of males--to what extent this improvement resulted from the sectoral transformation of black females, and to what extent it reflects better positions within the industries themselves.

The data in Table VII-10 reveal that the vast majority of employment in Personal services involves low-status occupations. In 1970, for example, over 90 percent of all black females employed in domestic service, hotels, and barber and beauty shops were in low-status occupations, and in two other industries--eating and drinking places and laundry and dyeing services--this proportion was over 85 percent. Thus, a good case can be made for the assertion that most of the occupational improvements of black females resulted from their shift from Personal services to other sectors where black females are less concentrated in low-status occupations. In comparison to the dramatic decrease of the proportion of black females in Personal services, the occupational improvements within the various industries were much less apparent.

It must be noted, on the other hand, that although Producer services, of all sectors, shows the smallest share of black females in low-status occupations, comparison with whites reveals that this results only from the fact that these industries in general do not make much use of low-status occupations. Indeed, black females in relation to white females show the highest concentration in low-status occupations in Producer services. All these industries have in common proportionately at least three times as many black as white females employed as operatives, service workers, or laborers, although this ratio is only two to one for the total labor force. Other industries with similarly high relative concentrations of black females in low-status occupations include utilities, miscellaneous social and professional services, and repair services.

This analysis of the occupational status of black males and females suggests that blacks in general are employed in better occupations in 1970 than they were in 1960. This improvement, however, is due more to the fact that they work in different industries than to occupational improvements within industries. Even within the rapidly growing Social services blacks are frequently employed in the traditionally black occupations of orderlies, porters, nurses' aides, and janitors. It thus appears that the occupational distribution can be considered as a zero-sum game, in which each industry is characterized by a certain functional occupational distribution which is dependent on technological improvements and organizational changes. Given this assumption, any significant occupational improvements of blacks (in relation to whites) must mean a worsening of the occupational positions of whites, given the same technology and organization. If this assumption is true, most improvements for blacks then will rest upon technological changes, unless blacks gain additional power that would enable them to make improvements at the expense of whites.

Income

On the basis of the previous findings about the educational attainment and occupational status of blacks, it comes as no surprise that their median income is lower than that of whites. In 1969, the median income of black males was about two-thirds that of white males (see Table VII-11). Although this is an increase over the 1960 proportion, it is relatively small given the fact that during the 1960's the low-wage industries of the Extractive and Personal services sectors accounted for decreasing shares of employed black males. Moreover, in a substantial number of industries (17 out of 37), black males in 1969 earned less in relation to whites than they did ten years earlier. This situation is particularly noticeable in the Transformative sector. Despite the increased share of black males in this sector during the 1960's, their median income in relation to that of whites declined in five of the eight Transformative industries. Of all industry sectors, black males in 1970 compared most favorably with whites in the Social and Personal services sectors.

The data for income demonstrate again that in comparison with whites, black females do much better than black males. Noteworthy is the large increase in relative median income of black females during the 1960's; in 1969, their median income was 92 percent of that of white females.

This high proportion is mostly due to the fact that in an increasing number of industries, particularly in the Social and Personal services sectors, black females have a higher median income than white females. The previous discussion showed that this cannot be the result of occupational status, for blacks in general are in lower status occupations than are whites. The high ratios for black females in the Social and Personal services sectors are, in contrast, largely due to the fact that they work more hours. This is demonstrated in Table VII-12 in which the mean number of yearly hours per black worker is given as proportion of the mean number of yearly hours for white workers. As the data in Table VII-12 show, black females work more hours in 1969 than white females in all Social and Personal services except in repair services and barber and beauty shops. (It must be pointed out, however, that in the case of income we are dealing with medians, whereas the data for hours refer to means. Since in the case of hours, we cannot assume a normal distribution, there should be a substantial difference between the mean and median of hours worked per year. For that reason, the data here are suggestive and do not permit a conclusive interpretation.)

Throughout this section, it has been noted that in relation to whites, black females compared more favorably than black males. What are the reasons for this situation? Two explanations are offered here. For one thing, the previous chapter showed that females in general are in less favorable positions than males. Thus, once the sex differential, in terms of the labor force situation, is controlled for not much additional discrimination occurs. Second, black females have a much higher labor force participation rate than white females. In general, there is a positive association between female labor force participation and socioeconomic status. Moreover, black females are more likely than white females to be head of household. In 1970, 9.0 percent of all white households and 27.4 percent of all black households were headed by women. (At the same time, however, these data dispel the notion that the "typical" black family has a female household head.) In sum,

these differences between black and white females indicate that blacks depend more on employment than whites. As an indication of this situation, the data in Table VII-12 show that black females worked more hours in 1969 than white females. Given this relatively stronger commitment to employment, black females should be expected to do as well, if not better, than white females.

ANGLOS, BLACKS, AND MEXICAN AMERICANS IN THE SOUTHWEST

Up to this point, this chapter has been confined to the analysis of the differences in the labor force situation between whites and blacks. As we pointed out earlier, concentration on the black-white differentials was necessitated by the fact that on the national level blacks are the only large minority for which census data are available. This is an important consideration, since the scope of this investigation is the national situation. On the other hand, however, much can be gained from a comparative analysis of different minorities. Since Mexican Americans are the second largest minority in the United States, the last section of this chapter examines the differences between Anglos, Mexican Americans, and Blacks.

The situation of Mexican Americans differs from that of the other two population groups in several ways. For example, the native language of most Mexican Americans is Spanish which brings with it a whole set of considerations that are special to this minority group. Since a substantial proportion of Mexican Americans--particularly the older generations--only has a partial knowledge of the English language, it can be expected to have many difficulties in the labor market. As a result, many of them are likely to hold relatively low-status positions.

Since much discrimination against specific population groups occurs on the basis of visible characteristics such as sex or skin color, many yet by no means all Mexican Americans, on the other hand, could be expected to fare relatively better than Blacks.

So far, little information exists about Mexican Americans and there are even fewer studies comparing the three population groups (notable exceptions include Shannon and McKim, 1974; Poston and Alvirez, 1973; Grebler et al., 1970; Fogel, 1967; Browning and McLemore, 1964). Much of this probably has to do with the inadequacy of the data that are available. Until 1960, the Census Bureau collected information about Mexican Americans only in the five Southwestern states (Arizona, California, Colorado, New Mexico, and Texas). Although the 1970 census permits a study of "Mexican Americans" on the national level, there are still many problems with the enumeration (see e.g. Hernandez, et al., 1973). As Poston and Alvirez (1973:699) note: "Mexican Americans per se were not enumerated in the 1960 census; instead they were identified on an ex post facto basis by the Bureau of the Census as white persons of Spanish surname." This approach is unsatisfying for obvious reasons; not all Mexican Americans have Spanish surnames nor is everyone with a Spanish surname Mexican American. By and large, as a consequence, this procedure has tended to underestimate the number of Mexican Americans in the United States. In this section, then, we shall refer to whites without a Spanish surname

as "Anglos" and whites with a Spanish surname will be called "Mexican Americans." No change is made for the identification of Blacks, except to use upper rather than lower case in this context.

For reasons of comparability with the 1960 census, we will restrict the analysis of the three ethnic groups to the Southwestern states. This geographical restriction unfortunately limits the investigation to the level of industry sectors, since the reduced data base does not permit an examination of more detailed industries. As was done throughout this chapter, the following discussion again differentiates between males and females.

The Industry Structure of Male Employment. The most striking difference in the industry allocation between the three ethnic groups is the large concentration of Mexican American males in the Extractive sector. Although the proportion of Mexican American males in these industries decreased substantially during the 1960's from 22.9 to 11.8 percent, thus reflecting the increasing urbanization of Mexican Americans (Grebler, et al., 1970), it still remained the highest among the three ethnic groups in 1970 (Table VII-13).

An interesting trend appears in the Transformative sector. In contrast to the declining proportion of employment for Anglo males during the last decade, Blacks and Mexican Americans have extended their shares of employment in this sector. Since the wages in this sector in general compare quite favorably with other industries, this trend might result in a relative improvement of the labor force positions of these two minorities.

We noted earlier for the national labor force that Blacks were strongly underrepresented in Producer services. The same situation prevails in the Southwest, and Mexican Americans are even less represented in this sector than Black males. On the basis of these findings, it can now be stated that Producer services in general tend to exclude minorities from employment, and this exclusion has not lessened much during the 1960's.

The overriding finding of the analysis of the industry structure of the three ethnic groups in the labor force is, apart from the relatively high share of Mexican American males in the Extractive sector, the great similarity in the way in which they are allocated to the various industry sectors.

The Industry Structure of Female Employment. In contrast to the similarity in the industry structure of employment for males, pronounced differences exist among the three ethnic groups for females. Clearly, the most outstanding feature of Table VII-13 is the high proportion of Black females in Personal services in 1960 and their subsequent move into Social services during the 1960's. This remarkable concentration of employment in Personal services is unique to Black females and it is not a general feature of minorities. The share of employment for Mexican American females in this sector never came close to that of Blacks. Black females, however, are not concentrated throughout the Personal services sector. The employment differential between Black females and the other two ethnic groups is due to one industry, domestic service. In 1960, 39.9 percent of all employed Black females worked in domestic service, compared with only 11.0 percent for Mexican American

Table VII-13

females and 4.7 percent for Anglo females. If domestic service is excluded from the Personal services sector, no significant differences exist in the shares of employment in that sector between the three ethnic groups.

The large concentration of Black females in domestic service is difficult to explain in view of the fact that the other minority group, Mexican American females, is much less likely to be employed as maids. Given the fact that Blacks and Mexican Americans share a rather similar socioeconomic situation, a similar employment pattern could have been expected. On the other hand, Mexican American females have a much lower labor force participation rate than Black females (lower even than that of Anglo females). Once again, the fact that the socioeconomic status of the two groups is similar could have led to the anticipation that they would participate in the labor force at a higher rate. This situation demonstrates that the labor force status of Blacks cannot be generalized for other minority groups as well. Although socioeconomic status have been used in explaining differences between Blacks and Anglos in the labor force, it does not explain all the differences between Blacks and Mexican Americans. As more data on Mexican Americans become available, a detailed study comparing Mexican Americans with Blacks should give us a much better understanding of the process by which minorities are employed than we have at present.

Again, it must be noted that for females as much as for males, Producer services exclude Blacks and Mexican Americans from employment. Although the gap has slightly decreased during the 1960's, particularly concerning Mexican American females, in 1970 Anglo females still are relatively twice as numerous in this sector than are Black females. One might want to examine this situation in conjunction with the trend in the Transformative sector where Anglos experience a proportionate employment decline. In contrast, minorities either expand their share of employment or maintain it at a constant level. This trend raises the possibility that one of the future employment differences between Anglo females and minority females could show an increasing absorption of minorities in the lower status occupations of operatives within the Transformative sector with Anglos holding the more prestigious clerical positions in Producer services.

One additional observation is warranted. One of the main findings in regard to the different industry allocation of Blacks and Whites was the underrepresentation of Blacks, and particularly of Black females, in retail trade. A similar situation exists in the Southwest, although in 1960 the share of employment in retail trade was quite similar for Black and Anglo males (11.2 and 12.3 percent, respectively). It is only during the 1960's that the employment gap in retailing emerged between Anglo and Black males. For females, however, the situation in the Southwest is very similar to that for the total labor force. But in contrast to Producer services, the exclusion of Blacks from retail employment does not extend to Mexican Americans as well. This is particularly true for Mexican American females whose shares of employment in retailing are much closer to those of Anglo females than to Black females. Again, the reasons for this remain unclear at this point. But it seems to have nothing to do with differential rates of self-employment or unpaid family work in this industry among the three ethnic groups. In other words, Mexican American females do not have larger shares of employment in retailing because they are more likely to own their stores or work as unpaid family members. The

proportion of self-employment in this industry is higher for Black females than for Mexican American females.

Educational Attainment

Since reference has been made to the assertion that Blacks and Mexican Americans as groups, have a similar socioeconomic status, it is useful here to examine one aspect of this, educational attainment. It must be expected that educational attainment of Blacks and Mexican Americans in the labor force is substantially below that of Anglos. But it is less clear to what extent this difference might vary among industry sectors. Similarly, although both Blacks and Mexican Americans have lower educational attainment than Anglos, it might differ between minority groups themselves. These possibilities will be examined in the following section. For the same reasons that were explained in the earlier part of this chapter which dealt with educational attainment on the national level, the proportion of the labor force which completed at least twelve years of schooling is chosen here as the indicator for educational attainment of the labor force.

Males. The data in Table VII-14 clearly show that Black as well as Mexican American males are less likely to have 12 years of schooling completed than is Anglo employment. We can compute the relative proportion for minorities having completed this level of education by dividing their proportions by the corresponding ones for Anglos. Following this procedure, for every 100 Anglos in the labor force with 12 years of schooling or more in 1970, there are 69 Blacks with the same educational attainment. The corresponding relative proportion for Mexican Americans is 60. Although these figures are substantially below the Anglo values, the gap in educational attainment between Anglos and the two minorities nevertheless has become narrower during the 1960-70 decade (the 1960 figures for Blacks and Mexican Americans were 75 and 60, respectively).

The data show in addition that the relative educational attainment of the two minorities varies substantially by industry sectors. Black males do relatively best in social services, and in two other sectors, their relative educational attainment is higher than that of the total Black male labor force. The relatively low educational attainment of the Mexican American male labor force is largely the result of their extremely low educational attainment in the Extractive sector, which, because of its size for Mexican Americans, influences the total values more than for the case of the other two ethnic groups. In the remaining sectors, their educational attainment comes much closer to that of Anglos.

Turning our attention now to the Black-Mexican American differentials in educational attainment, the data in Table VII-14 demonstrate that by and large, Black males have higher educational attainment than Mexican American males. In 1970, for example, 47.6 percent of all Black males in the labor force had at least 12 years of schooling completed compared to 41.1 percent of all employed Mexican American males. This finding holds for all industry sectors except Extractive industries and Producer services, in which Mexican Americans have a higher proportion of employment with 12 years of schooling completed. Noteworthy is the large educational differential between Blacks and Mexican Americans in the Producer services sector. Although proportionately even fewer Mexican American males are employed in these services, the ones that do work there are highly educated.

Females. The findings of educational attainment of women in the labor force are very similar to those of employed men. Black and Mexican American females in the labor force also have smaller proportions of employment with at least 12 years of schooling completed than do Anglo females. In relative terms, in 1970 there were 76 Black females for every 100 Anglo females with 12 years of schooling or more, with the corresponding proportion for Mexican American females being 66. These figures show, however, that minority females have higher educational attainment in relation to Anglo females compared with the relative educational attainment of minority males. (Incidentally, the findings in the prior chapter that females have higher educational attainment than males holds for all three ethnic groups, as revealed in Table VII-14.)

Again, the gap in educational attainment between Anglo females and Black and Mexican American females differs substantially by sector. In the Distributive sector, for example, hardly any difference existed in 1970 between Anglo and Black females in their proportion of employment with at least 12 years of schooling. As the share of employment of Black females in the Extractive sector and particularly in the Personal services sector, both characterized by a low degree of educational attainment, decreased substantially during the 1960-70 decade, the educational differential between Anglo and Black females became smaller. A similar trend can be observed for Mexican American females whose educational attainment approached that of Anglo females much more in 1970 than in 1960.

As we noted in the comparison of Black and Mexican American males, Black females, also, have a higher proportion of employment with 12 years of schooling or more than do Mexican American females. This holds for all industry sectors except in the case of Producer services.

The fact that Mexican Americans, for males as for females, have higher educational attainment in Producer services than Blacks is indeed interesting. This situation seems to be independent of the share of employment in these services for the two ethnic groups. In the case of males, Blacks are relatively more numerous in Producer services than Mexican Americans, whereas Mexican American females proportionately outnumber Black females in that sector. This again seems to suggest that education is not all that important as a determinant for the share of employment of a particular population in a given industry.

On the other hand, it can be expected that educational attainment is more closely related to the type of work, i.e., occupation. For example, professionals in general have a college degree. In that sense, the discussion in this section should lead us to expect that because of their higher educational attainment, Blacks in general will hold higher-status occupations than Mexican Americans. Moreover, the occupational status of both minorities will substantially be below that of Anglos. These expectations are examined in Tables VII-15 and VII-16.

Occupational Status

Males. It is hardly surprising to find in Table VII-15 that Anglo males hold better positions than Black or Mexican American males, but it is impressive how this difference is maintained in all six industry sectors. For example, Anglos

are much more likely to be professionals and managers than either Mexican Americans or Blacks. Anglos are also more likely to be craftsmen, whereas Blacks and Mexican Americans are holding operative positions. (It is only in Producer and Social services, in which Professional and Service occupations are the model occupational categories, that Anglos are less likely to be craftsmen than either Blacks or Mexican Americans.) Moreover, Black and Mexican American males have much higher proportions employed as laborers than do Anglo males. This differentiation is the most pronounced in the Extractive sector in which at least 70 percent of Blacks and Mexican Americans were laborers and farm laborers in 1970, compared to only 27.4 percent of Anglos.

While these findings are not surprising and are consistent with the data reported in earlier sections of this chapter as well as with many studies about Black employment, the more interesting aspect concerns the comparisons of Mexican Americans and Blacks in terms of occupational status. As we stated earlier, the higher educational attainment of Black males would lead us to expect them to hold higher status occupations than Mexican American males. The data in Table VII-15, however, do not support this expectation. Despite their higher educational attainment, Black males generally are in lower-status positions compared with Mexican American males. In all sectors, there are proportionately more Mexican American professionals and managers than Blacks with these occupations. On the other hand, Black males are more represented as laborers than are Mexican American males. Thus it is not too surprising that in the one sector, Producer services, in which Mexican American males do have higher educational attainment than Black males, their occupational status is significantly better than that of Blacks.

Females. As among males, Anglo females hold higher-status positions than Black or Mexican American females (see Table VII-16). The differences, however, vary from sector to sector. Transformative industries, for example, employ Anglo and minority females in quite distinct ways. In 1970 close to one-half of Anglo females in this sector were employed in clerical positions, whereas over 70 percent of Black and Mexican American females were operatives. The increased share of employment of minorities in this sector thus involves largely the low-status, blue-collar position of operatives, with Anglos increasing their share in the clerical positions. On the other hand, the occupational distribution of employment in the Distributive sector is very similar for the three ethnic groups.

In general, the difference between Anglo and minority females in terms of occupational status is not as large as is the case of males. In other words, Black and Mexican American females are employed in better positions in relation to Anglo females compared with Black and Mexican American males in relation to Anglo males.

Turning our attention to the occupational differences between Black and Mexican American females, the situation differs from that of males. Females of both minority groups are employed in very similar occupations, save for the Extractive and Producer services sectors. In the Extractive sector, Mexican American females clearly occupy the lowest occupational status of the three ethnic groups: over three-fourths are employed as laborers and farm laborers. On the other hand, Mexican American females do better than Blacks in Producer services.

Although the findings for females do not show much difference between Blacks and Mexican Americans, it should be pointed out that this similarity is more characteristic of the 1970 employment pattern than that of 1960. Even in 1970, however, Black females are less likely to be in clerical positions than Mexican American females, and more likely to be operatives.

These findings support, mostly for males but to a lesser extent also for females, the belief that discrimination against a minority group which can be readily identified by physical characteristics, plays an important part in the employment of Blacks. The data presented here are too incomplete to address all the reasons that could account for the difference in occupational status between Blacks and Mexican Americans. But it cannot be discarded that Mexican Americans as a minority group are less readily identified (which is one of the reasons why we do not have more data about this population group). After all, Mexican Americans are classified as whites by the Bureau of the Census. Thus, their employment "blends in" more easily with that of Anglos than in the case of Blacks. At this point, the interpretation of the employment differentials between Blacks and Mexican Americans must remain fragmentary, but the data presented here demonstrate that much could be learned about the employment pattern of minorities by a detailed comparative study including at least the two largest minorities in the United States, Blacks and Mexican Americans.

Chapter VIII

EARNINGS DISPERSION AND THE SECTORAL PATTERN OF EMPLOYMENT

In the last three chapters we have considered how industries differ in terms of their occupational requirements and how these sectors and industries differ in the way in which they utilize females and minorities. We have also established that the scheduling of work differs substantially from one industry to another. Although the mean number of year-hours per worker was quite similar across industries, some industries had a high proportion working a standard work week, while other industries employed large proportions of part-time workers in addition to those persons working more than full time. Moreover, the continuity of employment differs among industries. In some, persons predominantly work the entire year, whereas in others there is much intermittent employment.

All of these factors ultimately are reflected in monetary terms. Professionals have higher earnings than operatives, females earn less than males, blacks less than whites, and persons working full time the entire year receive more earnings than those working intermittently. In a fundamental and very real sense, therefore, earnings -- and given our concern with the labor force we necessarily must speak of earnings rather than income -- represent an extremely important "outcome" of the sectoral and industry distribution and of the entire sectoral transformative process.

Since our orientation throughout this report has been on a macro level, we do not take the earnings of particular individuals and relate them to other personal characteristics; rather, our concern is with the distribution or dispersion of earnings. Within this context we can expect the changes in the industry structure of employment between 1960 and 1970 to have had an impact on the dispersion of earnings for both the total employed labor force as well as for the four sex-race groups we have had occasion to examine. Unlike previous chapters which emphasized the demographic and sociological features of the sectoral transformation, the approach of this chapter is very much economic in concept and methodology.

This chapter will address the significance of earnings dispersion as part of the developmental process, an evaluation of the industry sector versus human capital approaches in accounting for the change in earnings dispersion 1959-1969, and the patterns of earnings dispersion by sector and industry when disaggregated into the four race-sex groups.

EVALUATING THE SECTORAL AND HUMAN CAPITAL APPROACHES TO EARNINGS DISPERSION

One of the standards by which economies are judged is the equity with which its product is shared by its participants. Although defining an "equitable" distribution of income is a normative problem on which it may be difficult to achieve concensus, in most practical circumstances the issue facing the government and its citizenry is whether the existing distribution should be made more or less equal, and how this objective can be accomplished. Since most economics are continually changing in structure and size, a precondition for successful

policy-making in this area is an understanding of how the forces already at work in an economy affect its income distribution.

In modern economic thinking there has been a tendency to separate questions regarding the efficiency with which resources are allocated from inquiries into the criteria by which the product resulting from a particular allocation is distributed. The basis for this dichotomy has been the belief that there always exists some combination of taxes and transfers that can translate the results of the market allocation process into the desired distribution of income. Although this is true in principle, the government has done little to alter the marked-determined distribution of income.

The problems involved in using tax and transfer programs to achieve an income distribution that departs markedly from the one resulting from the market allocation process have been ably stated by Thurow (1972: 6):

> Although there are no technical difficulties in reaching any desired distribution of income from any market distribution of income with tax and transfer policies, large overt redistributions of income from one individual to another may be difficult to achieve politically. This may be especially true if those to be aided are in the minority. Taxpayers may well be willing to help low income individuals earn a larger income but unwilling to give low income individuals a higher income. From the point of view of self-respect, low income individuals may also wish to be aided indirectly rather than directly. They may wish to "earn" their own living. (emphasis added).

For many people, interest in the question of income distribution is prompted by the belief that the inequality in incomes in the United States and elsewhere differs from their judgment as to what an equitable distribution of income should be. While there are undoubtedly some who would argue for a greater range in incomes, presumably to generate greater incentives in the market place, it seems fair to characterize the sentiment of the majority as preferring greater to lesser equality.

While Thurow and others have investigated the effects that would accompany variations in the distribution of education and training opportunities available to the population, there is another, and perhaps older, tradition in the literature which focuses on the income distribution effects accompanying economic development. Here economic development is taken to mean not simply a rise in per capita income, but the entire change in the economic and social fabric of a society that usually occurs as development proceeds. This section of the report examines the relationship between the industry structure of employment and the distribution of earnings. Although the analysis relies on relatively recent data for the United States, it is believed that some of the questions investigated are of sufficient generality as to be relevant to a broader, more historical, context. We begin with a brief review of the literature.

The view of the relationship between economic development and income inequality that emerges from the data that have been surveyed is ambiguous.

International cross-sectional data tends to indicate that income inequality is less in countries at higher stages of development (Lydall, 1968); however, longitudinal studies do not present such a clear picture, for in some of the developed countries studied by Lydall in the twentieth century, earnings inequality failed to decline at all as development proceeded. In any event, these correlations are "gross" and fail to indicate whether it is development *per se* (as measured, for example, by higher levels of income per capita), or other concomitants of growth that are associated with the smaller dispersion in earnings among more developed countries. Indeed, Chiswick (1971) presents evidence that economic development exerts *no* effect on inequality independent of its influence on the distribution of schooling and the rate of economic growth. However, the relevance of this distinction is questionable. The term economic development, as opposed to economic growth, usually refers to the amalgam of change (demographic, economic, and institutional) that typically occurs in the course of raising the level of well-being of a population. Consequently, one suspects that most students of development would be rather critical of the use of per capita GNP to summarize a country's state of development. On the other hand, the question of the paths through which economic development affects the income or earnings distribution is a highly interesting one.

Kuznets (1955, 1966) had earlier researched this question. In comparing differences in income inequality between nations, Kuznets emphasized that differences in productive structure were a major explanatory factor. He suggested that the way in which countries developed had a major influence on the income distribution. The hypothesis he advanced is that earnings distribution in manufacturing industries tends to be more unequal than the earnings distribution in agriculture. Thus, as the labor force shifted toward more employment in industry, the aggregate concentration of income was expected to increase. He predicted that later stages of development would bring about greater equalization within industry and therefore, a lessening of inequality to the level characteristic of more developed countries. Since further study failed to bear out this generalization, Kuznets (1971) shifted his attention toward *inter-* rather than *intra*-sectoral differences in earnings. Many underdeveloped countries are characterized by enormous variation in output per worker between industry, agriculture, and services. Thus, Kuznets argued that only as sectoral productivity levels began to converge would incomes also converge. The United Nations Economic Commission for Latin America (1972), Langoni (1973) and Fishlow (1973), also have emphasized the sectoral pattern of employment and the distribution of earnings among sectors as important factors in understanding comparative inequality among nations.

In the spirit of the studies cited above, the analysis of U.S. census data is directed towards determining the effect of the sectoral pattern of employment on earnings inequality within the United States. It is generally believed that in an economy where most prices are market-determined, the earnings distribution, which is a major component of the income distribution, depends on the industrial pattern of final demand and the distribution of marketable skills among the population. Although there is no necessity to regard these determinants of earnings distribution as competitive, they have rarely been synthesized into a pluralistic model of earnings determination. Rather, one can identify, on the one hand, what we shall call a sectoral approach to the earnings distribution and, on the other hand, a human capital

approach to this question. In its extreme version, the sectoral position, which we associate with the work of Clark and Fisher, assumes that the distribution of earnings primarily reflects the allocation of employment among the three sectors of the economy, the primary, secondary, and tertiary. In essence the distribution of earnings within each sector is regarded as an intrinsic, unchanging, characteristic, with the pattern of final demands for goods and services determining the sectoral pattern of employment. Thus we have a theory of the earnings distribution that places great weight on the nature of aggregate demand.

In contrast, the human capital approach (Becker, 1964; Mincer, 1974) is a supply-side theory of the earnings distribution. Advocates of this viewpoint see the earnings distribution as a reflection of the skill-mix of the labor force and the rates at which these skills are rewarded. Studies which use this approach to project changes in the earnings distribution have assumed that the returns to the productivity-related characteristics of workers are constant over time and thus changes in the distribution of earnings are regarded principally of changes in the distribution of labor force skills (Chiswick and Mincer, 1972).

These approaches to analyzing the earnings distribution naturally lead to different perceptions about which policies will be most successful in effecting the desired distribution of earnings. Adherents to the sectoral approach are likely to advocate policies that alter the speed or the pattern of growth by which an agrarian economy transforms itself into an industrial or service economy. An important issue for these advocates might be the relative advantages of a program of rural versus urban industrialization. Human capital theorists, on the other hand, have focused on the role of education in economic development and have considered the consequences of altering both the distribution of educational expenditures and the average level of education for the earnings distribution. Given these diverse approaches to the analysis of the earnings distribution, we believe the data to be examined bears not only on the usefulness of each approach as a predictive device but also has implications regarding the appropriate focus of public policy.

We propose to evaluate the merits of these two approaches to analyzing the earnings distribution by comparing how well they predict the changes in the dispersion in earnings in the U.S. that occurred between 1959 and 1969. In addition, we will suggest how the sectoral and human capital approaches can be combined into a single model which we will evaluate relative to either of the two simple approaches.

The earnings distributions we consider here apply only to white and black males, although at a later point we shall introduce race and sex data. The data we employ are the same as used throughout this report (see Appendix A), but for this section, we chose a 10% sample of white males from the original sample. All blacks, however, were included. Female workers were excluded because of data considerations. These data are poorly suited for the analysis of the earnings distribution among women in the human capital framework because of the emphasis this approach places on labor force experience and post-school investment. These data are not explicitly reported by the census, but in the case of males they are usually inferred by assuming that individuals participate in the labor force continuously after leaving school. However, in the case of

women, where an intermittent pattern of labor force participation for purposes of child bearing and child rearing is well documented (Mincer and Polacheck, 1974), this assumption is clearly inappropriate. Because there is no alternative way of measuring labor force experience we find satisfactory, women have been excluded from the analysis. Our decision to consider white and black males separately is based on repeated findings that the structure of the human capital earnings functions estimated for each group differ markedly (Weiss, 1974; Harrison, 1973).

Because it is crucial that we be able to identify a worker's sector of employment, we have adopted sampling criteria that are different from those used in most previous analyses of U.S. Census data. Specifically, we have selected only those workers classified as employed and "at work" or "with a job but not at work" due to illness or vacation. Excluded from the sample are persons who are unemployed or nonparticipants in the labor force.

One implication of this selection procedure is that the difference in the rates of return to schooling between blacks and whites is far less than that reported in other studies. The reason is that the lower rates of return to schooling usually estimated for blacks occur, in part, because increased education does not insulate blacks from unemployment as effectively as it does whites. As a result, even if schooling increases the rate of pay of blacks to the same extent as it does for whites, the rate of return to schooling would not be as great for blacks, since the amount of time they work at this higher rate does not increase the same. By limiting the analysis to employed persons we have removed the employment advantage experienced by educated whites which tends to equalize rates of return.

A second property of the data must also be noted. There is a lack of congruence between the time period to which the earnings data refer and the time period reflected in the data on industry of employment. Because the earnings data describe annual earnings, they refer to the calendar years 1959 and 1969. In contrast, the data on industry of employment are reported for the reference dates of the censuses, which were conducted in April of 1960 and 1970. Thus the observations for industry and employment data do not coincide in time. Although there is an obvious potential for bias in this procedure, in that some males have different industry employment at the time of the census than they did during the prior year for which their earnings were reported, we have no way of knowing the directions or magnitudes of the biases and therefore have not attempted to "correct" the data.

The sectoral approach we are evaluating considers the industry pattern of employment as central to the distribution of earnings. That this type of analysis traditionally has been in terms of sectors rather than of industries surely reflects the paucity of good data as much as it does the judgement that sectors, rather than industries, are the appropriate units of analysis. The six-sector classification that has been used throughout the report is employed here.

The socioeconomic characteristics of the labor force that we consider are few in number and are dictated by the human capital models we employ, as developed principally by Mincer (1974). These models will be elaborated in the following section.

There is, of course, no entirely satisfactory way to summarize a complete earnings distribution by means of a single statistic. Each of the various measures that have been proposed, such as the Gini coefficient, the coefficient of variation, and the variance of the natural logarithm of earnings, have characteristic features that make them more sensitive to certain changes in the distribution than to others. (An evaluation of various measures of dispersion in terms of their implicit normative criterion and their sensitivity to specific changes in the distribution has been done by Atkinson, 1970).

The measure used here, the variance of the natural logarithm of earnings, has several desirable properties that commend it above alternative summary statistics. First, by virtue of the use of logarithms, it is a relative measure of dispersion. This means that proportional changes in earnings over time have no effect on this statistic. This is desirable, for we would not wish to confound purely inflationary effects with real changes in the distribution of earnings. This property also is relevant when making international comparisons, since it implies that this index of dispersion does not depend directly on the value of any country's currency. In addition, the implications of the human capital approach regarding the effects of changes in the distribution of the skills on the dispersion in earnings are most easily expressed in terms of the variance of the natural logarithm of earnings, hereafter referred to as log-earnings. (This derivation appears in Chiswick, 1974 and Mincer, 1974.) Let us now consider how well the approaches we have discussed explain changes in the variance of log-earnings between 1959 and 1969.

Changes in the Variances of Log Earnings: 1959-1969

The variances of the natural logarithm of earnings of males 16 years of age and above, classified by race and sector of employment appear in Table VIII-1. The statistics for the entire labor force by race are reported in the first row of the table. Note that in each racial group the dispersion in earnings declined between 1959 and 1969, the larger change occurring among black males. Our objective in this section of the paper is to consider the reasons for these changes in earnings dispersion.

We first consider how far the simple versions of the sectoral and the human capital hypotheses will take us. The sectoral position can be stated more concretely with reference to the data in Tables VIII-1 and VIII-2. We interpret the structuralists as arguing that the dispersion in earnings within a sector can be regarded as a characteristic that is intrinsic to that sector, at least over a period as brief as a decade. A less rigid version of this position is that relative to the changes in the dispersion in earnings within sectors, the movement of workers among sectors is a much more significant component of the change in earnings dispersion.

A cursory examination of Tables VIII-1 and VIII-2 lends support to this view. The rankings of the sectors between 1959 and 1969 appear rather consistent. The Extractive sector and Personal services usually have the greatest earnings dispersion and these sectors have been employing a decreasing share of the labor force. The sectors in which earnings are less dispersed are the Transformative and Social service sectors. The latter especially has increased its share of employment over the decade. These observations suggest that the sectoral view has promise, since the movement of workers from sectors

with a large dispersion in earnings to sectors with low dispersion is consistent with the overall decline in the variance of log-earnings.

The sectoral position can be evaluated quantitatively if we take the mean levels and variances of the natural logarithm of earnings prevailing in each sector in 1959 as typical of the relative dispersion in earnings in that sector. The data in Table VIII-2 indicate the changing weights to be attached to these means and variances in order to predict the change in earnings dispersion between 1959 and 1969.

The total variance in log-earnings within each racial group can be analyzed into within-sectors and between-sectors components as in an analysis of variance. The within-sectors variance is simply the weighted average of the variance in each sector, the weights being the proportion of persons employed in the given sector. Thus, it is easy to see how the changes in sectoral weights between 1959 and 1969, which placed increasing weight on sectors with less dispersion, could reduce the within-sector variance in log-earnings.

In contrast, it might seem inappropriate to hold the sectoral means constant over the decade in order to compute the change in the between-sectors variance, since it is obvious that mean earnings in each sector have risen as a result of economic growth and inflation. However, the fact that the variance of the natural logarithm of earnings is independent of scale implies that the between-sector variance, obtained by weighting the squared deviations of the sectoral means from the grand mean of earnings, will be insensitive to proportional changes in the arithmetic mean in each sector. Therefore, the assumption that the mean level of log-earnings in each sector is constant over the decade is weaker than it may appear, for it implies only that the average rate of increase in earnings is constant across sectors. We predict the expected change in the between-sector dispersion in earnings between 1959 and 1969 by assuming the mean of log-earnings to be constant in each sector and varying the sectoral weights. We first calculate the new grand mean and then sum the weighted squared deviations of the sectoral means from the new grand mean. These estimates of the predicted values of the between- and within-sector dispersion in earnings in 1969, along with the actual values calculated for 1959 and 1969, appear in Table VIII-3.

For each racial group the major component of earnings dispersion is the within-sector variance, accounting for around 90 percent of the total variance in earnings. Although the proportions of the variance in log-earnings occurring within and between sectors will of course depend on the fineness of the sectoral groupings, the general impression conveyed by the data in Table VIII-4 is that they are not likely to be sensitive to the particular aggregates chosen, within the range of detail provided by the census data. To illustrate, we calculated the within-group variance when workers were allocated to the 37 industries used in the report. We found that the within-industry variance was nearly as large as the within-sector variance, being no less than 80 percent of the total variance in log-earnings for each racial group.

These findings indicate that to explain the causes of earnings dispersion at a moment in time one must have a theory of the within-sector variance in earnings. However, it does not follow that the within-sector component looms so large in the explanation of the <u>change</u> in earnings dispersion. In fact, for

Table VIII-3

PREDICTED AND ACTUAL VALUES OF VARIANCES IN LOG-EARNINGS BY RACE, 1959-1969: THE SECTORAL APPROACH

Race - Sex Group	1959 Actual	1969 Predicted	1969 Actual	Predicted Change 1969 - 1959	Actual Change 1969 - 1959
White Males					
Total variance	1.308	1.221	1.202	-.087	-.106
Within sectors	1.187	1.131	1.137	-.056	-.050
Between sectors	.121	.091	.065	-.031	-.056
Nonwhite Males					
Total variance	1.318	1.096	1.042	-.223	-.277
Within sectors	1.071	.958	.975	-.114	-.097
Between sectors	.247	.138	.067	-.109	-.180

nonwhite males, the change in between-sector dispersion in earnings exceeded the change in the within-sector component by a factor of two. In other words, while the sectoral approach would do poorly as an explanation of the cross-sectional dispersion in earnings, since it regards the within-sector dispersion as exogenous, it may still be a good predictor of changes in earnings dispersion.

Let us now see how consistent these changes are with the predictions of a sectoral model that attributes the change in earnings dispersion within racial groups entirely to the weights assigned to each sector. The relevant statistics appear in columns (4) and (5) of Table VIII-3. In general, the sectoral approach underpredicts the reduction in earnings dispersion that occurred between 1959 and 1969. It accounts for 82 percent of the change among white males, and 81 percent of the change among black males.

The sectoral calculations underpredict the reductions in the between-sector component of earnings dispersion most seriously. For both white and black males the model predicts roughly 60 percent of the actual reduction in the between-sector variance. Evidently the assumption that the change in mean earnings in each sector increased at an equal rate between 1959 and 1969 is inappropriate. Since the sectoral approach, as we have formulated it, offers no explanation as to why relative changes in mean earnings may vary among sectors, it could, in principle, be dominated by one which considers how mean earnings are determined in each sector.

The human capital approach discussed above has the potential to account for the kinds of changes in the earnings distribution described in Table VIII-3. Put simply, this approach seeks to determine the market prices paid for the various productivity-related characteristics of workers and to explain the level and distribution of earnings in terms of the distribution of these characteristics among the labor force. By holding these prices constant, the effects of changes in sectoral means and variances, to the extent they reflect changes in the characteristics of the labor force, can be captured by this approach.

We maintain our stratification of the labor force by racial groups and estimate separate earnings equations for each one. The general form of the earnings equation is:

$$(1) \quad \ln Y = b_o + b_1 S + b_2 Ex + b_3 \ln (Wks) + u,$$

(See Mincer, 1974, for the derivation of this equation.)

where the dependent variable is the natural logarithm of the individual's annual earnings, S is the person's educational attainment, Ex is years of labor force experience, ln (Wks) is the natural logarithm of the number of weeks the individual worked during the year, and u is a disturbance term, assumed to have the appropriate properties.

An expression for the variance of ln (Y), our index of dispersion, can be derived straightforwardly from equation (1) and appears as follows:

$$(2)\quad \mathrm{Var}\ \ln(Y) = b_1^2\,\mathrm{Var}(S) + b_2^2\,\mathrm{Var}(Ex) + b_3^2\,\mathrm{Var}(\ln Wks) + 2b_1b_2\,\mathrm{Cov}(S, Ex) + 2b_1b_3\,\mathrm{Cov}(S, \ln Wks) + 2b_2b_3\,\mathrm{Cov}(Ex, \ln Wks) + \mathrm{Var}(u).$$

This specification departs in a minor way from Chiswick and Mincer's model (1972) by treating the rates of return to schooling and experience as parameters and not random variables. However, the results reported by Chiswick (1974) provide some justification for these modifications, for he obtains an inappropriate sign for the additional variables he includes in his equation under the assumption that rates of return are random variables.

Table VIII-4 reports the estimates from the 1959 data of equation (1) for males of each race. These equations fit the data reasonably well, the R^2 typically being around .30; all variables are significant and have the anticipated signs. We hesitate to compare the coefficients in Table VIII-4 to those reported for these groups by other writers because, as noted above, we have defined our sample somewhat differently.

Nevertheless, our results can be used to predict how the dispersion in earnings within similarly defined groups would change in response to changes in the distribution of labor force characteristics between 1959 and 1969. This calculation is performed using equation (2). The independent variables in this equation were assigned values obtained from the 1970 census; the regression coefficients and the variances of the error terms, assumed to remain constant between 1959 and 1969, were given the values reported in Table VIII-4.

Table VIII-5 compares the actual changes in earnings dispersion that occurred between 1959 and 1969 with those changes that were predicted by the method described above. In general, the human capital model does poorly. The narrowing of the distribution of earnings is underpredicted for both racial groups and the model does most poorly in the numerically important category of white males.

While these results are hardly supportive of the human capital approach, they do not constitute a complete test of the model. This is because previous work (King, 1975) has indicated that a principal reason for the model's failure is that a major source of change in the earnings distribution over the decade is attributable to changes in the residual variance. Since the way we have expressed the model assumes the residual variance to be constant between 1959 and 1969 it is unable to capture the effects of these changes. Whether this is a shortcoming of the model depends on whether one believes changes in the residual variance are exogenous or endogenous to the human capital framework. Mincer (1974), for example, has argued strongly that changes in the residual variance are explicable within the context of the human capital model and has presented considerable evidence to that effect.

Table VIII-4

ESTIMATES OF EARNINGS FUNCTIONS FOR MALES BY RACE, 1959

Table VIII-5

COMPARISON BETWEEN ACTUAL CHANGES IN THE VARIANCE OF LOG-EARNINGS 1959-1969 AND CHANGES PREDICTED BY HUMAN CAPITAL MODEL

Race	Variance 1959 (Actual)	Variance 1969 (Actual)	Variance 1969 (Predicted)	Actual Change 1969-1959	Predicted Change 1969-1959
Whites	1.308	1.202	1.307	-.106	-.001
Nonwhites	1.318	1.042	1.263	-.276	-.055

Unfortunately, it is difficult to specify a priori how the residual variance will change in response to complex changes in the characteristics of the labor force. As a result, we are led to adopt an ad hoc procedure to investigate the relationship between the residual variance and labor force characteristics. We express the residual variance as a function of the means and variances of, and covariance among, schooling and experience, as suggested by Mincer's work. Because the changes in the residual variance that we wish to explain occur over time, we will estimate the hypothesized relationship using cross-sectional data (the 37 industries are the units of observation) in order to assure the independence of the data used to estimate the relationship and the data that provide the test for the model.

The equation we estimate has the form

$$(3) \quad \mathrm{Var}\,(u) = d_0 + d_1 \bar{S} + d_2 \,\mathrm{Var}\,(S) + d_3 \,\overline{Ex} + d_4 \,\mathrm{Var}\,(Ex) + d_5 \,\mathrm{Cov}\,(Ex, S) + e,$$

and is estimated across two groups of 37 industries. To provide the dependent variable for this equation, equation (2) was estimated for members of each racial group in each industry, using the 1960 Census data. The estimated variance of the error terms in each industry equation then serves as the dependent variable in equation (3). The estimated equations appear in Table VIII-6.

We utilize the results in Table VIII-6 to estimate the change in the residual variance in earnings between 1959 and 1969 that is likely to have occurred in response to changes in labor force characteristics between these years. This is perhaps an extreme measure of the endogeneity of the residual variance,but it should serve to place an upper bound on the explanatory potential of the human capital approach. We estimate the change in the residuals for white and black males.

Our results indicate that the predicted change in the residual variance is -.121 for white males and -.430 for black males. When these predictions are combined with those derived from the deterministic part of the human capital model, the modified predictions are a decline of -.122 compared to the actual change of -.106 for white males and -.488, compared to the actual change of -.276 for black males. We see that treating the residual variance as endogenous greatly improves the predictive ability of the labor force approach in the case of white males, and has a marginal effect on the accuracy of the model when applied to blacks. This causes us to doubt the usefulness of the procedure we have employed and leads us to question just how large is the systematic component of the residual variance.

We turn next to consider whether the human capital and the sectoral approaches can be combined to improve the accuracy with which changes in earnings dispersion are forecast. We do this by estimating earnings equations, such as equation (2), that are specific to each sector. This method should dominate the sectoral approach since it enables us to dispense with the assumption that the dispersion in earnings within sectors is constant over time and permits different rates of change in the mean level of earnings in each sector. It should also be superior to the aggregate human capital approach, since it makes a weaker assumption regarding the parameters of the model. It assumes only that the

Table VIII-6

THE DETERMINANTS OF THE RESIDUAL VARIANCE IN LOG-EARNINGS WITHIN INDUSTRIES, 1960

* denotes coefficient is significant at the .05 level.

** denotes coefficient is significant at the .01 level.

model's parameters are constant within sectors, which in principle permits the parameters of the aggregate earnings equation to vary over time in response to changes in the sectoral distribution of employment.

Once again we disaggregate the change in earnings dispersion into within- and between-sector components. The predicted within-sector change in the earnings distribution is obtained by means of equation (2). The sector-specific parameter estimates for this equation were obtained from the earnings functions in Table VIII-7. The parameters are once again held constant at their 1959 levels and the distribution of labor force characteristics is permitted to vary between 1959 and 1969. The predicted change for each racial group appears in Table VIII-8.

The intersectoral change in earnings dispersion is estimated by using the equations in Table VIII-7 to predict the mean level of log-earnings in each sector in 1969, given the 1959 parameters and the observed qualitative changes in the sector's labor force over the decade. Using these new sectoral means, a grand mean is calculated using the 1969 sectoral weights, and the deviation of the sectoral means from the grand mean is squared and the weighted sum taken over all sectors. The predicted change in intersectoral inequality is also entered in Table VIII-8 and can be compared to the actual change that occurred during the decade. The table also reproduces the results for the simple sectoral and human capital approaches discussed above.

The combined sectoral-human capital model severely underpredicts the reduction in earnings dispersion between 1959 and 1969. Most serious is its failure to account for the reduction in the between-sector variance over the period for either whites or blacks. The model predicts a negligible change in between-sector earnings dispersion when in fact there were significant reductions, especially among black males. If we compare these between-sector results to those obtained for the simple structural model, we find that the structural model outperforms the combined model. Evidently, the assumption of proportional changes in sectoral means is closer to the truth than the estimates obtained through the use of the human capital model, despite the fact that the latter takes explicit account of changes in the skill mix.

Although the combined model predicts the change in the between-sector variance more accurately, the change in the between-sector variance still suffers in comparison with the simple sectoral model. Since the combined model differs from the sectoral model by predicting changes in sectoral earnings dispersion rather than assuming it to be constant, it must be the case that the human capital approach is on average underpredicting the reduction in earnings dispersion within each sector. This may occur because the estimates reported in Table VIII-8 were obtained by constraining the residual variance in each sector to be constant over the decade. We will now relax this constraint and observe if there is a significant improvement in the performance of the combined model.

Reported in Table VIII-6 are the equations we estimated to predict the residual variance in earnings within an industry, for males of both races. These equations are now employed to predict the expected change in the residual variance within each sector by the following method. The residual variance

Table VIII-8

COMPARISON OF PREDICTED CHANGES IN EARNINGS DISPERSION
1959-1969

Racial Group	Actual Change	Predicted Combined Sectoral and Human Capital Approaches	Predicted Sectoral Approach	Predicted Human Capital Approach
White males				
Total variance	-.106	-.023	-.087	-.001
Within sectors	-.050	-.015	-.056	
Between sectors	-.056	-.008	-.031	
Nonwhite males				
Total variance	-.277	-.033	-.223	-.055
Within sectors	-.097	-.021	-.114	
Between sectors	-.180	-.012	-.109	

"within-sectors" is a weighted average of the sector-specific residual variance:

$$(4) \quad \text{Resid} = \Sigma_i f_i \text{ Resid}_i$$

where f_i is the proportion of the labor force employed in a given sector. The change in the residual variance may therefore be expressed as

$$(5) \quad \text{Resid} = \Sigma_i f_i \Delta \text{ Resid}_i + \Sigma_i \text{ Resid}_i \Delta f_i .$$

The change in the residual variance in each sector for each race was predicted using the equations reported in Table VIII-6. These predicted changes were aggregated using the 1960 sectoral employment weights, forming the first term on the right-hand side of equation (3), and the second term was obtained using the 1960 sectoral residuals and the change in sectoral employment weights between 1960 and 1970.

These calculations predict a change of -.175 in the residual variance for white males and -.059 for black males. Combining these results with those reported in Table VIII-8, we find that the combined human capital-sectoral approach grossly overpredicts the reduction in within-group earnings inequality among white males, -.183 compared to the actual change of -.056, but comes rather close to the actual change in the within-sector dispersion among black males, -.081, compared to the actual change of -.097. This is virtually the opposite pattern of accuracy exhibited by the aggregate human capital model.

It should be remarked, however, that even if treating the residual variance within sectors as endogenous would enable us to perfectly predict the change in the within-sector dispersion in earnings, the poor performance of the combined model in predicting changes in the between-sector variance would severely limit its general accuracy. Indeed, the simple sectoral approach outperforms the combined approach by such a large margin that even with perfect prediction of the change in the residual variance within sectors the combined model would do just marginally better than the sectoral model, and then only for white males.

SECTOR AND INDUSTRY DIFFERENCES IN EARNINGS DISPERSION

The prior discussion suggests that the general assumption of the human capital model to consider the returns on weeks worked, experience, and education as constant across industries is not warranted when changes in the dispersion of earnings over time are to be explained. The preceding section demonstrates that the sectoral approach yields predictions about changes in the dispersion of earnings that are superior to those obtained from the human capital approach. In other words, as the allocation of employment to industries changes, it can be expected that there are also changes in the dispersion of earnings for the total labor force, since the variance of earnings within industries differs from one industry to another. In order to illustrate how the sectoral transformation of the labor force affected changes in the dispersion of earnings between 1959 and 1969, the dispersion of earnings for sectors and industries are discussed in the present section.

The differences in the variance of earnings among sectors seem fairly stable (Table VIII-9), since they persist across each of the race-sex categories

in both 1959 and 1969, but there is a substantial range across the different industries. Although the variance of earnings for total white males, for example, decreased from 1.308 in 1959 to 1.202 in 1969, the sectors show differing patterns. The variance of earnings dropped slightly in the Transformative and Distributive services sectors, whereas it increased significantly in Producer and Personal services. As we pointed out earlier, the decrease in the variance of earnings for all white males resulted largely from the proportionate decrease of white male employment in the Extractive and Personal services sectors, where the variance of earnings is the highest. Black males experienced a similar pattern; there were large decreases in inequality in the Extractive and Transformative sectors, but the inequality rose in all of the other sectors. White females, on the other hand, experienced a large decrease in inequality from 1.883 to 1.423 which was accompanied by decreases in the variance in all six sectors with the sharpest drops in Social services, Distributive and Extractive sectors. The variance of black females decreased similarly, with the exceptions of the Extractive and Producer services.

Sectoral differences exist independently of the race-sex hierarchy. When the six sectors are rank-ordered in terms of the magnitude of variance, a clear pattern emerges (see Table VIII-10). The Extractive and Personal services sectors have the highest variance in every case, except for black females. Sectoral differences for the latter vary a great deal between 1959 and 1969. This may be the result of the dramatic decrease in the share of total black females in Personal services. Over one-half of all black females were employed in that sector in 1960, but this proportion was reduced to 27 percent in 1970.

The Transformative and Social services sectors have the least variance, with the exception of white females in 1960 and black females in 1970. The Distributive and Producer services sectors often trade positions, but they remain in the middle of the ranking.

The inequality in the Extractive sector is largely the effect of agriculture, which has a mix of very high and very low earnings (Table VIII-9). Mining, on the other hand, is fairly homogeneous. One obvious difference between these two industries is the predominance of unionized wage labor in mining and the combination of self-employment and non-unionized farm laborers in agriculture. Personal services has characteristics similar to agriculture in this respect -- the hotels, eating and drinking places, repair and laundry services, and barber and beauty shops have high percentages of self-employed workers, and little unionized wage labor. In addition, employment in these industries tends to be more transient than employment in the economy as a whole.

The Transformative sector clearly has the lowest variance. This is particularly significant for males, for they are heavily concentrated in this sector. It is also the most unionized industry sector and, of its industries, metal, machinery, and chemical industries have among the lowest variance of earnings of all industries. These three industries can be classified as modern industries, in contrast to the more traditional industries such as textiles and food. Again, the former group of industries is more unionized and uses less part-time employment than the remainder of the Transformative sector.

Differences within the Distributive, Producer, and Social services sectors are more difficult to evaluate. Transportation and communication have

low values for males, but not for females (unionization again doubtless plays a role for males); retail trade is higher in variance than any of the other Distributive services. Again, the proportion of employment working part-time seems to be related to this situation, for even in transportation a large share of female employment works part-time. It can be expected that the more the labor input of workers within an industry varies, the larger will be the variance in earnings in that industry.

Banking and insurance services have the least variance of any of the Producer services. In contrast, accounting, miscellaneous business, real estate, and legal services, all having a high proportion of self-employed (see Table VIII-4), show the highest variance. Earnings variance in Social services is more difficult to evaluate, for it differs widely among the race-sex groups. However, postal services and government are uniformly low while welfare and medical services are uniformly high in variance of earnings. Although unionization is not an important influence in Social services, the contrast between postal services and government, on the one hand, and medical services, on the other hand, suggests that bureaucratization of work has an effect similar to that of unionization in reducing the dispersion of earnings. This situation seems to be due to the fact that within bureaucracies there is more of a continuum from low to high status occupations and a greater bunching of earnings, whereas in medical services the occupational structure is characterized by a high concentration of employment in professional occupations. In 1970 64.5% of all males in medical services were professionals. As these professionals have earnings that are substantially higher than those of any other occupational group in medical services, we can expect the variance of earnings to be high as well. This line of reasoning is supported by the fact that the variance of earnings in medical services is much lower for women who also are much less concentrated in professional occupations. Moreover, the dispersion of earnings for males, white and black, in hospitals is far less than that in medical services (see Table VIII-9). In the case of black males in 1970, for example, the variance of earnings in hospitals was .828 as compared with 2.012 in medical services. Again, fewer males employed in hospitals are professionals compared to those in medical services. For white males in 1970, the difference was 44.6 percentage points, and it was 23.0 for black males. Since hospitals have a much higher degree of formal organization than even those medical offices in which physicians form a pool, these findings indeed suggest that bureaucratization and formal organization tend to reduce the variance of earnings.

There was a significant decrease in the variance of earnings during the 1960-1970 decade for all four race-sex groups, but this in itself is difficult to interpret except in the most general way. Overall, we can say there was an important decrease in inequality and this is a favorable trend, but on the level of particular industries this need not always be favorable for the individuals involved. Consider the example of black males in employment. The variance of earnings here rose from .510 to .781, but the greater resulting "inequality" may in truth mean that black males, who were formerly relegated to low-status jobs in which the earnings variance was low, had an opportunity during the decade to obtain more better-paying positions, thus increasing the inequality. The dispersion of earnings, therefore, must be interpreted with care. A low variance of earnings in a given industry signifies only that its

workers had very similar earnings. But this could mean many different things: all workers could be in low-status occupations, or all could be professionals. An industry with a high variance of earnings almost certainly means the existence of low-paid and high-paid individuals. In that sense, the amount of variance of earnings in an industry can be interpreted as an indicator of the variety of different positions or the occupational mix that exists in this industry. This interpretation is quite similar to the meaning of the variance of earnings for the total labor force. As we noted in the introduction to this chapter, variance of earnings increases during the early stages of industrialization and decreases in the course of further economic development.

Since a change in the variance of earnings can be the reflection of many different situations, it is helpful to relate these changes to the actual frequency distributions of earnings. When an important criterion for comparison, such as race, is selected, the use of the variance or mean can be extremely misleading; many different odd-shaped distributions can give rise to the same average. For instance, the mean for any group can be raised substantially by introducing a small number of high-earning observations, but this says little about changes in the welfare of the overall group.

The frequency distributions for all four race-sex groups are given in Table VIII-11. Since the rise in both nominal and real income during the decade shifted the entire distribution upward for every group, we will interpret the data through the graphs in Figure VIII-1 and VIII-2 which reveal significant differences in the shapes of the curves between the race-sex groups in 1960 and 1970. The most visual difference in these graphs is that between the sexes. Females have relatively smooth curves that are steeply declining from low earnings to high earnings, with only a moderate second peak in the $2,000-5,000 categories for white females in 1959 and 1969 and black females in 1969. Figure VIII-2 thus shows that the decrease in the variance of earnings for females mainly resulted from the decrease of the peak in the lowest income category. For males, there is no one single peak that is as extreme as the lowest income category for females, although for black males the $0-999 category also is the largest. One of the most pronounced changes occurred for white males who show a high concentration in the $10,000-14,999 category for 1970.

What is striking about the distributions is the importance of the lowest income category which even for white males accounts for the second highest proportion. This group of very low income is disparate in composition and therefore somewhat difficult to interpret. It includes those who were new entrants and reentries to the labor force during some part of the year, as well as the "regular" part-time, part-year workers, since $1,000 and under is less than the poorest-paying occupation and is far below subsistence income for one year. While 23.6% of white males in 1959 were in this category, 27.1% of black males, 32.8% of white females, and 51.2% of black females earned less than $1,000 -- a striking contrast. In 1969, however, the differences were less acute: 15.2% of white males, 13.4% of black males, 20.8% of white females and 23.3% of black females were in the bottom group. The range is reduced from 27.6% in 1959 to 9.9% in 1969.

It appears from the graph that the $2,000 mark in 1959 and the $3,000 mark in 1969 are especially significant, since frequencies here are in a trough which is between the very low incomes on the one hand and the less-steep higher

Table VIII-11

255

incomes on the other. This strongly implies that the bimodality is in fact a result of unemployment. But unemployment affects the distribution of earnings in diffuse ways. Persons who are unemployed at one point in time find employment later on, and others become unemployed who had jobs before. Thus, rather than removing 5% from the labor force for an entire year, as many as 15% of a group such as black females may absorb the effects of a slow-down by suffering a reduction in earnings for part of the year.

Although some "unemployment" may be a voluntary absence from the labor force for a limited time, it is likely that changes within a race-sex group between 1960 and 1970, especially among males, are largely a reflection of differences between the two years in the demand for workers. While differences between men and women largely may be explained by desire of some females for more flexibility in work commitment, it is difficult to believe that this "taste" for part-time work among females would change so radically over ten years. This shift seems to be evidence of demand factors. Unemployment rates may not reflect these differences in demand for women, particularly since married females are less likely to collect unemployment insurance or register officially as unemployed. It is also important to note that high variability in weeks worked for blacks is not a result of demand for part-time work. Low incomes and sporadic employment are related in a circular fashion. There is little incentive to stay with a job that pays poorly, and there is little reason to pay a worker well if he is likely to be transient.

CONCLUSIONS

This chapter, it will be recalled, began with a consideration of the accuracy with which three approaches to the analysis of the earnings distribution predict changes in earnings dispersion in the U.S. between 1959 and 1969. It was found that the simple assumption that the variance in earnings within each sector was constant between 1959 and 1969 and the mean levels of earnings increased proportionally enabled us (simply by considering the effects of sectoral shifts in employment) to predict the change in earnings dispersion among white and black males tolerably well. On the other hand, assuming that the rewards to the education and experience of the labor force remain fixed in relative terms over the decade leads to poor predictions of the change in the earnings distributions of both white and nonwhite males.

Although the accuracy of this approach can be improved by considering changes in the residual variance to be endogenous, as we have done, ours is an ad hoc approach which requires much further theoretical and empirical work on the nature of the residual varaince in earnings functions before its appropriateness can be judged. That the empirical relationships we have estimated between the residual varaince and the human capital variables may not be stable is indicated by the fact that the predictive equation was more accurate for white males than for black males and did poorly when applied at the sectoral level.

We conclude, therefore, that the sectoral approach offers a useful view of how the earnings distribution in the U.S. has changed over time.

The influence of the sectoral transformation of the labor force on changes in the dispersion of earnings were demonstrated by our discussion of the differences in earnings dispersion among sectors and industries. The data

BEST COPY AVAILABLE

showed that agriculture and Personal services have a high dispersion of earnings for all four race-sex groups. Since these industries employed proportionately fewer persons in 1970 than ten years earlier, a decrease in the overall dispersion of earnings was to be expected.

Although the human capital approach has the attractive feature of being derived from neoclassical principles, the parameters of the model do not seem sufficiently stable for the model to serve well as a predictive tool. This observation is somewhat puzzling because cross-sectional tests of the human capital model have generally been strongly supportive of the framework. When regressions are run across individuals in various industries or states it is usually concluded that constraining the parameter estimates to be identical across these units diminishes the explanatory power of the model only marginally. Findings of this type suggest that at a given moment in time the variations in the parameters of the model are of no practical importance and the assumption that they are constant may be a good one. On the other hand, the structure of the model does vary considerably over time.

It would be useful of course to understand and predict how the parameters of the human capital model are likely to change over time, but it seems fair to say that there is no macro theory of human capital and little is known about the determinants of the model's parameters. This is a major gap in the theory of human capital and an area where further research could be fruitfully applied.

Chapter IX

THE SECTORAL TRANSFORMATION AND THE NATURE OF WORK IN A SERVICE SOCIETY

The purpose of this study has been to focus attention on the ways by which the industry structure of the U.S. has been changing. In considerable detail we have examined various facets of the sectoral transformation, emphasizing the "how" of this change as well as the "who" in terms of the social characteristics of those occupying different industry positions. Other than Chapter VIII, where we addressed the problem of the relationship between industries and the dispersion of earnings, little attention has been directed to the consequences of the sectoral transformation.

In the last chapter we depart from our approach, which has relied heavily--some readers may say excessively--upon the presentation and analysis of large masses of data from the 1960 and 1970 censuses, to make a number of general, rather speculative, comments on some of the consequences, mainly sociological, of the sectoral transformation. We emphasize the movement into service work and its implications. One of the themes throughout this report has been that work in service industries differs from that in goods-producing industries, and we shall want to explore the significance of this statement from the standpoint of the following dimensions: the conditions of work, work satisfaction, alienation and the nature of social classes. We will, therefore, take up some of the points touched upon in Chapter I when we addressed the question of whether or not there would be a Service Revolution.

A general caveat should be introduced at this point. We took special pains in the Introduction to argue that the Fisher-Clark three-sector classification scheme was increasingly inadequate because the tertiary or service sector was too heterogeneous to be useful for analytical purposes. It was for this reason that we broke down the tertiary sector into the four service sectors that are used throughout this report. Yet in the prior paragraph we were contrasting the service industries with the goods-producing industries. Aren't we failing to follow our own advice?

The answer is that for certain purposes it is warranted to speak of services as an entity, especially in instances such as the above when we were making a basic contrast between services and goods-producing industries. For most purposes, however, it is preferable to refer to the four service sectors and even at times to specific service industries. It should be stressed, for example, that in the U.S. there has not been a shift of employment towards services per se in the last several decades--but very predominantly a shift to Social and Producer services. Personal services have decreased as a proportion of total employment while Distributive services have done little more than hold their own. One of the distinguishing features of the service society is the lack of servants; it is not so much individuals who serve, but rather firms and organizations. Increased per capita income and the concept of the welfare state in industrially advanced countries has enabled most, if by no means all, of the groups of society to have use of services (i.e., education and health) that formerly had been the privilege of only a few.

The industry changes over the last 100 years, as was sketched in Chapter II, have been impressive. In 1870 more than one-half of the labor force (52%) was in the Extractive sector; it had declined to a mere 4% in 1970. In a century of fantastic increases in the production of manufactured goods, the Transformative sector gained in its proportionate share from 23% to 33%. By contrast, Social services grew from just 3% to 22% in the 1870-1970 period (see Tables II-1 and II-2).

No one can say with any authority what the industry distribution will look like in 2070, or even in the year 2000. It is clear, however, that the Extractive sector no longer can play the decisive role it did in the 1870-1970 period, simply because it has dwindled to such a low figure that it cannot decline much more. Even should Social and Producer services continue to increase their relative share in the coming decades it is unlikely that the two together will exceed 40% of the total by 2000. In other words, we don't believe that any sector will have the relative weight as in 1870 and the consequent dynamism of the Extractive sector. Therefore, the greatest changes in sectoral distribution probably have been made. This does not mean that further changes will not take place nor, more importantly, does it imply that since the major part of the sectoral transformation appears to be behind us it loses its significance and importance. We would argue that many of the effects of this change are not yet clearly perceived, and in part this may be due to the delayed effect many sectoral changes have on social institutions. An example of this point is unionization. The fact that services are much less unionized than in the Transformative sector at the present time does not necessarily mean that this relationship will continue to hold. Perhaps 50 years from now there will be little difference between the two in degree of unionization.

Returning to the present situation, Victor Fuchs, to whom we have turned repeatedly in the course of this investigation because of his path-breaking book, The Service Economy (1968), raises a number of provocative and important points, mainly of an economic nature, in a last chapter entitled, "Some Implications of the Growth of a Service Economy." They merit brief review, because they merge into the more sociological considerations to be taken up later.

Fuchs believes that the move to a service economy has made increasingly unreliable a key economic statistic, the gross national product, because current measures of real output in most of the service industries have been unsatisfactory. Because of the inherent problems in measuring output and productivity in the services even though substantial improvements can be made, it is only realistic to anticipate "that these efforts are likely to leave considerable margins of uncertainty."

One feature of the problem of productivity in services has to do with changes in demand. It is difficult to determine the productivity of a number of services without knowing differences in peak and non-peak demand and the "size of transaction," meaning how much is transacted with one customer making one purchase. Productivity may be enhanced more by increasing the size of the transaction than by increasing the number of transactions.

Another economic consideration with demographic and sociological overtones has to do with the conceptions of labor and capital and the "embodiment" of technological change. Economic discussions of embodiment until recently have stressed physical capital, assuming that capital is a fixed factor and that labor is variable. This may apply in manufacturing but it is not satisfactory in describing the situation in services. Labor-embodied technological change takes place when successive new cohorts to the labor force bring with them the advances in knowledge and new procedures that make for that change. As Fuchs notes (1968:197), "The concept of labor embodiment is likely to be most relevant when formal schooling and job security are important, as in the professional and technical occupations. Three-fourths of all professional and technical workers are employed in the Service sector."

Finally, Fuchs introduces a factor affecting productivity in the services that generally is neglected in economic analysis: "the consumer as a factor in production." Many services depend upon the knowledge, experience, motivation and even the honesty of the consumer. Providing examples that range from the school room to the supermarket and laundromat, Fuchs shows that the consumer "actually works" and if he doesn't function properly then the service "product" is likely to be inferior. Such considerations are rarely to be found in goods-producing industries.

This last consideration of productivity in the services shows how closely an economic analysis can get to a sociological one, for in considering producer-consumer relations we enter the sociological realm of interpersonal relations and norms governing behavior. And it is here where Fuchs, in his interpretation, has a tendency to go astray. To counter the well-known arguments that "industrialization has alienated the worker from his work, that the individual has no contact with the final fruit of his labor, and that the transfer from a craft society to one of mass production has resulted in the loss of personal identification with work" (1968:189), Fuchs maintains that the coming of the service economy "may imply a reversal of these trends" for it makes possible the "personalization" of work; "...the direct confrontation between consumer and worker that occurs frequently in services creates the possibility of a more completely human and satisfactory work experience." Since everyone can summon plenty of personal examples of distinctly unsatisfactory relationships with workers in service industries, be it government "bureaucrats" or auto mechanics, the question is why all too often the "possibility" of satisfactory relations does not work out that way in practice.

SOCIOLOGICAL DIMENSIONS OF WORK IN SERVICE INDUSTRIES

Let us begin with a discussion of the conditions of work. Chapter V demonstrated that the growth of services has been accompanied by an expansion of employment in professional, semi-professional, clerical, and service occupations. At the same time, changes in the industry structure have not favored the growth of manual occupations, which have been experiencing decreases in their share of

total employment. The former set of occupations have in common that they usually do not require physical strength, although there are exceptions, such as some work in hospitals. Three of these four expanding occupations are white collar and do not involve working conditions as hazardous as often exist in mining or steel production. In this sense, the growth of services and their related expansion of white collar and service occupations can be interpreted as an improvement in the physical conditions of work.

It also was mentioned earlier that work in many service industries is more flexible than in goods-producing industries. This flexibility is due to a number of reasons. Fuchs (1968) called attention to the fact that the size of establishments is much smaller in services than in manufacturing. Small firms usually require less formal organization of work than large establishments and therefore permit more flexibility. But there is another, more important, difference between services and goods-producing industries; namely, the extent to which work is segmentalized. Work in many manufacturing industries is carried out on an assembly line basis with each person performing only a segment of the total process of production. Since this type of production depends on each worker doing his task, the absence of a few workers can disrupt the entire production process. For that reason, the technology requires a continuous and reliable input of labor. Even in manufacturing industries and establishments that do not employ assembly-line techniques of production, tasks usually are very standardized and therefore can be scheduled quite rigidly.

This rigid scheduling of work cannot be done in most services, since much of service work involves close contacts with the consumer whose needs and preferences need to be taken into consideration. Services rarely can be stored so it is difficult to establish long-term production schedules that smooth out variations in demand. Production in services, therefore, is less segmentalized and a person's work depends less on the work of others. In that sense work in services is more self-contained than in Transformative industries. This situation would suggest that workers in services can identify more with their work as compared with other industries.

But it is quite obvious that this identification with work does not exist in all services. Clerks in retail trade and service personnel in eating and drinking places are good examples of these exceptions. What needs to be taken into consideration, however, is the fact that a large part of this work is part-time employment. The bulk of workers in these positions are young and consider their jobs as only temporary as, for instance, those making plans to finish school. Not much identification with work may be expected or is needed in these cases. It is important to note, however, that services, due to their greater flexibility of work scheduling, at least offer opportunities to those who voluntarily seek part-time employment. (As we stressed before, this interpretation does not imply that we consider all part-time employment to be voluntary.)

In general, it can be expected that many service establishments will attempt to introduce more capital in order to increase productivity. Many short-order food places, for example, increasingly resemble assembly lines. Inevitably this will mean that services will become more formally organized and their work more rigidly scheduled. This situation already exists in a number of services such as communication, banking, and insurance. But in the case of insurance, while the rationalization and bureaucratization of work goes on in the giant home offices, there are thousands of self-employed insurance agents who head, at most, a small office. Even though this trend towards rationalization will make work in services more similar to that in goods-producing industries, there are limits to that convergence. Many services such as education and health for a number of reasons cannot become as capital intensive as goods-producing industries.

What does all this mean for the individual worker? In a study of industrial work and workers' consciousness, Kern and Schumann (1970) found that autonomy of work was an important determinant of work satisfaction. Autonomy in this case referred to the degree to which workers were able to schedule their own work. Among the various groups, maintenance workers expressed the highest degree of work satisfaction. The main task of these workers was to repair machinery that had broken down. Despite the time pressure under which they worked, for the continuation of production depended on their promptly repairing the machines, the maintenance workers considered themselves to be experts who were able to determine how much time their work took and could therefore best organize their work schedules.

In many instances, work in services has the same qualities. Consider the example of a social worker, for whom the time spent on a particular case largely depends on the problems involved. Similarly, legal services require a certain amount of research for which the labor input not always can be precisely predicted. And even in the case of postal services, mail-delivering persons are able to schedule the pace of their work within given limitations. These examples do not imply that there are no time constraints on the work. To be sure, social workers have a certain case load, as do lawyers, and the mail has to be delivered to a certain number of households. But all three cases have in common, although the first two more than the last, that the workers are in a position to make their own decisions about how to divide their time among the clients. It therefore could be hypothesized that persons employed in services have greater work satisfaction than those in Transformative industries.

The case of Social services, in particular, is interesting for an examination of work satisfaction. These services increase with economic progress and make up, according to Mandel (1970:206), the creative part of the labor force. Their growth

> ...means that a larger and larger section of mankind are freed from the obligation of carrying on uncreative work. Here we have not a survival from a dreary past but the harbinger of a wonderful future. When automatic machines will do all the work needed to produce goods

for current use, men will all become engineers, scholars, artists, athletes, teachers, or doctors. In this sense, but in this sense only, the future is indeed with the "tertiary sector."

One need not share Mandel's optimistic vision of the future to grant that Social services are distinguished from all other industries in that their main goal is the enhancement of the quality of life of the population. Persons employed in these services therefore can think of themselves as helping other individuals, a feeling that can compensate for other possibly dissatisfying aspects of their work. Moreover, Social services, by and large, are nonprofit, although their professional and administrative personnel receive substantial salaries.

Doing creative work, on the other hand, does not necessarily provide for job satisfaction. There is also the possibility that persons in Social service are not really interested in serving the public, for as Fuchs (1968:188) reminds us: "Teachers can ignore their pupils; doctors can think more of their bank balances than of their patients." To assume that the interests of workers in these services are totally congruent with the interests of their clients would indeed be naive. But despite these possible conflicts between the purveyor of a service and its consumer, Social services at least offer a potential for work satisfaction that most other industries do not have.

Work satisfaction is closely related to the concept of alienation, as far as its social-psychological interpretation is concerned. Alienation of work recently has received a great deal of attention. In general, it has been understood as the workers' inability to identify with their work and to derive satisfaction from their economic activities. This subject has been a recurring theme in the sociological literature, as witnessed by the studies of Blauner (1964) and Seeman (1959; 1972). The major dimensions of alienation, as defined in these studies, are (1) powerlessness, (2) meaninglessness, (3) isolation, (4) normlessness, and (5) self-estrangement. Applying these dimensions to the employment situation in services, we would expect to find a lower degree of alienation in services than in goods-producing industries. But of course, one also should expect important differences among services themselves. More persons employed in communication, banking, retail trade, or eating and drinking places are likely to feel more alienated than those in other services such as education, health, government, or advertising. While here we can only speculate about the degree of alienation, the discussion does suggest that the unit of industry is a useful analytical category, especially when combined with occupation, to examine differences in work satisfaction and alienation among workers.

In contrast to the social-psychological approach to alienation that we find in the sociological literature, alienation in its original conception was a structural concept. This distinction is important for it closely relates to the concept of social class. As will be seen later on, both concepts merit re-examination with the advent of a service-dominated labor force.

BEST COPY AVAILABLE

Although the concept of alienation was first developed by Hegel, it is Marx' use of the term that has most influenced sociological thinking. For Marx. alienation becomes manifest in two relationships that are closely connected: man and his labor, and man and his products.

In his Economic and Philosophic Manuscripts of 1844 Marx (1963) differentiates between unalienated and alienated labor. Unalienated labor is Marx' term for man's productive activity that is creative and which enables him to "appropriate" nature. It is through this form of labor that man develops his dominant position in the environment. In this sense, unalienated labor is the basis for man's fulfillment of his personality. Alienated labor, in contrast, prevents man from developing his full potential. The prototype of this labor for Marx would be work on an assembly line. The repetitive tasks and the narrow application of skills that man encounters in this work situation do not permit him to become master over his environment.

The second major form of alienation is the separation of man from his product. In part, this alienation results from the character of alienated labor itself but in addition, the product does not belong to the worker any more. "It is no longer the laborer that employs the means of production but the means of production that employ the laborer" (Marx, 1958:310). In that sense, the worker not only loses control over his work and his product, but also over the conditions of his work.

Both manifestations of alienation are seen by Marx as the necessary consequence of the capitalist form of production. Essential to this type of production, although not restricted to it, is the division of labor, without which capitalism could not function. It is mainly the division of labor that Marx sees as the obstacle to the full development of man's creativity. But Marx is not very precise in spelling out what exactly he means by the division of labor. Is it the division of labor into different occupations such as farmers, miners, welders, bus drivers, or nurses that creates alienation, or does this concept refer to the segmentalization of the production of a particular commodity into many different and limited tasks? Marx related both meanings of the division of labor to the occurrence of alienation, but it is primarily the segmentalization and specialization of work that he sees as the main evil of industrial capitalist society. Not only does the division of labor form the basis of alienation, together with the alienation of labor and the separation of man from his product it also leads to the emergence of the two classes in industrial society, one who controls the means of production and the other which is employed by these means

At this point, we should note that Marx largely was preoccupied with the conditions of work in manufacturing. As Kline (1967:427) nicely puts it: "Marx's paradigm of economic activity is the bringing into being of shoes and ships and sealing wax, not the polishing of shoes, the piloting of ships, or the packaging of sealing-wax." The main reason for Marx' interest in the goods-producing industries is his evaluation of "making" as a socially superior activity to only "doing" or "knowing". Only that work is productive activity which

is objectified, i.e., which leaves a permanent mark. "For Marx, a poet who kept his poem to himself, like a painter who destroyed his painting as soon as it was completed, would not count as a producer." (Kline, 1967:428).

This brief summary of Marx' concepts of alienation, the division of labor, and social classes raises many important questions. For example, can a socialist economy abandon the division of labor? The question that is important for the present discussion, however, is, "Has the shift of employment towards services changed the conditions of alienation and the formation of social classes?" Since both concepts are key elements in sociological analysis, they merit a re-examination in light of the past employment changes.

We noted earlier that one of the characteristics of services is the absence of a tangible product. In that sense, work in some services can be considered to be even more alienating, for labor and product become one. An example of this are sales workers. Their work is labor and product at the same time. It is labor in that it can be exchanged for wages, and it is a "product" for the customer in the sense of assisting him in his needs. On the other hand, however, large parts of service work are less conducive to precise scheduling. Much of the work in services, moreover, cannot easily be divided into segments. To that extent, services should be expected to have a lower division of labor and their work therefore should be less alienated.

This alone, however, does not permit the conclusion that society is no longer divided into social classes, for the separation of man from his means of production still exists. But one particular feature of services needs attention: its largest sector, Social services, largely belongs to the public sector. Therefore, the relationship between capital and labor is different in this sector than in privately owned industries. Although many employees in hospitals or universities, for example, still have not much autonomy over their work and its conditions, this situation no longer is the exclusive result of the domination of capital (which in any event is not privately owned), but it increasingly stems from the different interests of the employment groups within a certain institution and the board governing it. In that sense, the organization of these employment groups becomes rather crucial for improvements in their positions within the various establishments. It is mainly this development that makes the concept of social classes no longer as useful as it once was. As Touraine (1971:81) puts it:

> Productivity, efficiency, the rationality of educational policies, land management, the organization of communications and authority in large organizations--it is more useful to analyze these elements of economic progress than the 'traditional production factors' capital, labor, and land. No longer is it the concentration of available surpluses but the rational organization of human and technical equipment that governs economic development. Under these conditions, the idea of two basic classes that constitute separate milieux, one reduced to subsistence, the other to managing surpluses, loses its importance.

The rejection of the class concept as a practical tool for sociological analysis cannot mean, however, that post-industrialism is the advent of the classless society. We are very far from that! What it does imply, however, is the need to identify prestige, power and social conflicts in terms of interest groups as they result from a common work situation, coalitions, and alliances; similar to the approach taken by Dahrendorf (1959). Empirically oriented sociology, in any event, has never convincingly demonstrated how the more or less arbitrary divisions of occupation, income, or socioeconomic status are related to the theoretical notion of social class as linked to the process of production. It is here where we can most profit from the use of the concept of industry, for interest groups are identifiable through the concepts of occupation and industry combined (although other criteria may be introduced). This new analytical tool could contribute substantially to the connection of our theoretical concepts with their empirical measurement in mobility studies, which ultimately should lead to a better comprehension of the changing character of the service society.

The importance of interest groups can be illustrated with the example of professionals. While in the past, professionals have considered themselves to be outside the traditional form of labor conflict between employers and employees, recent strikes by teachers and nurses represent a change in that attitude. It thus can be expected that professionals in the future increasingly will form collective bargaining organizations, be they formal unions or special professional associations. In that sense, the low degree of unionization to which Fuchs (1968:185) referred, is not likely to hold in the future.

While professionals, by the very nature of their expertise, are in a position to bargain for particular benefits, this bargaining power can even be achieved by work groups with much less status. This is due to the tendency, particularly in Social services, to spread responsibility for the proper delivery of services more widely. Let us again consider the example of health services. Although in hospitals, physicians and nurses carry the primary responsibility, the functioning of a hospital organization depends to a large extent on nurses' aides and non-medical personnel. No hospital can function over an extended time period without the cooperation of these employment groups. In this context, Marx' distinction between class <u>in itself</u> and class <u>for itself</u> is essential, for an interest group defined by structural characteristics, such as occupation and industry, becomes an "interest group <u>for itself</u>," i.e., a political force, only when it comprehends its position within the network of an organization or society. This situation has been linked by Touraine (1971:7) to the concept of alienation:

> The traditional forms of social domination have been profoundly transformed (in postindustrial society)...We continue to speak of "economic exploitation" but this process is more and more difficult to isolate. The term loses its objective meaning when forced to define our consciousness of social contradictions better expressed as "alienation," that much criticized notion which is, nevertheless, more useful than ever.

BEST COPY AVAILABLE

As long as employment groups are not aware of the alienated character of their work position (even though it might differ from one position to another), their "dependent participation" will continue to avoid social conflicts. Once they reach a consciousness of their employment situation, they are in a position to overcome the social contradictions by collective means.

This discussion has demonstrated that alienation in the structural sense has a meaning completely reversed from the one referred to in the social-psychological approach of Seeman (1959) and others. While the social-psychological approach views the alienation of a worker as a subjective expression of work satisfaction in its various components, the structural meaning of alienation refers to objective conditions of work situations. In the latter sense, the worker's consciousness of his alienation is to be interpreted positively, for it is a necessary condition for the elimination of alienation.

Our discussion demonstrates further, however, that much more information is needed about the nature of work in services. On the one hand, much work in Social services is creative and thereby unalienated. Other services, on the other hand, are alienated similar to that in goods-producing industries, yet the worker may find greater work satisfaction in services which would make an awareness of alienation much less likely. It is an examination of these four concepts --conditions of work, work satisfaction, alienation and dependent participation-- which offers the most promise for a sociological study of the implications of a service society.

SOME POLICY IMPLICATIONS OF THE SECTORAL TRANSFORMATION

Throughout this report a constant theme has been the utility and fruitfulness of looking at work from the vantage point of industry position. Our readers should now be prepared to decide for themselves whether they concur in this orientation. But aside from the evaluation of the success of this endeavor in providing for a better understanding of how the transformation of the labor force actually takes place, there is the related but independent question of what this implies for manpower policies. In terms of this policy, what sorts of strategies can be suggested that emerge from this report?

Banal as it appears to be, our first recommendation is for more research on the nature of services. Since few new analyses about services have appeared since Fuchs' study his statement still stands (1968: 13):

> Perhaps the most urgent need of all is for more and better-quality data concerning the service industries. Although the United States is now a service economy, the statistical reporting system largely reflects the interests and conditions of an economy dominated by agriculture and industry. We need more analysis, but we also need the factual basis that will make the analysis more fruitful. One unmistakable finding of this study is that there are significant gaps in our statistical information concerning service output, employment, prices, wages, investment, and profits. These gaps must be filled if

we are fully to understand this sector or, indeed, if we are to understand the economy of which it is the major part.

A good example of the inadequacy of statistical information about services is the U.S. Census of Commerce which reports statistics for only selected services. And even for these, the amount of information is a good deal less than can be found in the U.S. Census of Manufacturing. Thus, while we fully concur with Fuchs that employment, output, and productivity must be seen in their interrelationships to fully understand services, we will devote the following section to some implications for manpower policy as they derive from a study of employment.

One important area that needs more attention than it has received is the work life cycle. Only within this framework can we evaluate the meaning of work for individuals. Such an endeavor, of course, cannot be adequately undertaken with census data, for it requires complete work histories of individuals. But some of the findings in this report nevertheless have interesting implications. Consider the case of eating and drinking places. It was found in Chapter III that this industry has one of the lowest yearly hours per capita (it ranks 34th of 37 industries). In other words, a substantial part of employment in this industry is part time and intermittent. Other industries such as domestic service or barber and beauty shops can be similarly characterized.

Before concluding that here is a situation requiring policies that would promote stable employment and the reduction of part-time employment, we have to look more closely at who is occupying these positions. A significant proportion of total employment is made up of teenagers and college-age students who take this work on a part-time basis while they finish their schooling. Another segment is made up of women who are supplementing the family income by working on a part-time basis. Neither of these groups want full-time employment, and from the standpoint of their employers this arrangement also is best, given the great variation in demand (daily and often seasonally) for labor.

Moreover, these industries give many persons their first work experience which often is useful in securing later employment. In that sense, the peripherality of work in many industries can be, as Morse (1969) reminds us, beneficial both to the employer and the employee.

This discussion of part-time employment in terms of specific labor force groups and sets of industries leads to a more general distinction that we believe to be essential for manpower policy. This concerns the relationship between structure and population. More specifically, we need to know the requirements of the economy for labor and the characteristics and qualifications of persons of working age. After all, the general goal of any employment policy is to facilitate the match between the demand for labor and the supply of labor.

In this context we think that the interrelation of the industry structure and the occupational structure is of particular relevance. It is undeniable that manpower policies in the United States preponderantly have been very much oriented towards the occupational sphere, particularly those manpower programs designed to train individuals for occupational positions. As has been

BEST COPY AVAILABLE

pointed out, some of these programs have been busily engaged in preparing individuals for jobs that did not exist. Perhaps if more attention had been given to the dynamics of the industry formation this miscalculation of the demand for labor would not have happened. Our position is that a careful analysis of sectoral and industry changes in recent decades is useful as a guide for the future.

The emphasis on the occupational dimension of work is not all that surprising, since both sociology and economics have given much attention to the characteristics of individuals and employment. It is in this tradition that Blau and Duncan (1967) studied social mobility and status attainment, and the human capital approach takes a similar perspective. But as was demonstrated in Chapter VIII, there are several limitations to the human capital approach when it is applied in the context of structural changes such as the sectoral transformation of the labor force. Undoubtedly, the characteristics of individuals, their family background, education, etc. and the influence of these variables on the employment history of these persons is valuable and necessary, but it has tended to overshadow the little work that has been done on the structural aspects.

One of the most important questions in terms of the structure of employment is the variability in the occupational "mix" within industries, i.e., the variety of positions. Some of these positions, for example, may involve very flexible work which more easily could accommodate part-time and intermittent employment than would be the case with other positions. Similarly, the educational requirements also can be expected to vary substantially.

The interconnection of industry and occupation is important in several other ways. We demonstrated in Chapter V that occupational changes result from two sources: changes in the industry structure and changes in the occupational distribution within industries. This distinction is very fruitful for it shows how much of the overall change in the occupational structure is the result of a different use of individuals within industries. This again relates to the flexibility of employment within given industries that was discussed above.

The other major implication of this procedure concerns the work situation of women and minorities. As noted before, the sectoral transformation of the labor force has been crucial for the employment of women, since over 75 percent of all employed women are to be found in services. Similarly, blacks experienced very substantial changes in their allocation to industries between 1960 and 1970; the proportion of black males decreased in the Extractive and Personal services sectors and black females showed a proportionate decrease in Personal services that was truly impressive. Since the Extractive and Personal services sectors are characterized by a large proportion of low-status occupations, the shift of blacks to other sectors has improved their employment situation in substantial ways. Even when these industry shifts do not result in a change in occupation this "horizontal" or situs mobility can result in an improved occupational standing for the individual. Consider the extreme case of domestic maids who become janitresses in a hospital. Although their task in both employment situations is cleaning up after other people, the context of this work is quite different. In domestic service, the work relationships are largely paternalistic, whereas in the hospital they are more formally organized. One advantage of work in larger organization is its greater likelihood to be covered by labor legislation such as minimum wage laws.

We conclude, therefore, that the sectoral transformation of the labor force generally has helped to better the employment situation of blacks (and Mexican Americans, as was shown for the Southwest). Moreover, the sectoral transformation also narrowed the gap between blacks and whites in terms of occupational standing and earnings, although this increased similarity was more pronounced for females than for males.

We must add to this, however, that the narrowing of that gap was somewhat less than expected. It can be seen from the 1970 data that women and minorities still were concentrated in low-status occupations compared to white males. This discussion has important implications for policies concerning the employment of women and minorities. Since the sectoral transformation of the labor force did not bring the work status of these employment groups up to that of white males, we should not have expected industry changes to be a substantial source for future improvements, the major part of the sectoral transformation of the labor force probably has already taken place. This leaves the possibility that changes in the occupational distribution within industries will result in improvements for women and minorities. But as we demonstrated in Chapter V, for instance, women were less likely to be employed as professionals in 1970 than ten years earlier. Thus, there are some doubts that changes in technology and organization of work within industries will lead to significant improvements of these employment groups in relation to white males. These findings suggest that changes in the industry structure and in the occupational distribution within industries do not automatically give women and minorities the work status of white males. This view implies that a great deal of the equality between employment groups will have to come at the expense of white males. In other words, increasing proportions of higher-status positions will have to be staffed by women and minorities and white males therefore are likely to increase their share in the lower-status occupations. Only if we assume that the number of high-status positions within industries can be increased at will, could greater equality of employment be achieved without affecting the position of white males. This, again, emphasizes how much more information we need about the flexibility of work in given industries.

Policies aimed at achieving greater equality of employment of course must take into consideration that the work life cycle of different employment groups could vary. But the past ten years have brought about so many changes in sex-roles, for example, that it no longer can be taken for granted that the employment of women is inherently less stable than that of men. In fact, there already is some evidence that when occupational status is controlled for, those industries with a high proportion of female employment have lower quit rates than industries in which there are only a few women employed. Thus, close governmental monitoring of hiring practices and assistance of the government to firms and institutions will be an important source for the achievement of greater equality among the various race-sex groups in the labor force.

DISCUSSION OF THE 1/100 PUBLIC USE SAMPLE TAPES

The data used in this study were taken from the 1960 and 1970 1/100 Public Use Sample tapes made available by the U.S. Bureau of the Census. The format of these data represents a great change from the way in which census data traditionally have been made available. All information on the tapes is arranged by persons; for each person, his or her age, sex, ethnic status, industry, education, occupation, etc. is given. This format permits detailed cross-classification of persons by more than 40 social, economic, and demographic characteristics. This type of information permits the investigator to treat census data in the same manner as he would a secondary analysis of sample surveys. That is, he can manipulate all the variables included in the census as he sees fit. This potential is particularly useful for the present study, for many of the variables selected there are no cross-classifications published in the census reports. The sample used for this study is based on questions from the 15 percent sample.

How then do the data reported in this study compare with the published census reports? For this research we considered all employed persons who were either "at work" or "with a job but not at work" due to illness or vacation (see Character P31, "Employment Status Record," Codes 1 and 2, in the Description and Technical Documentation of the Public Use Samples, U.S. Bureau of the Census, 1971 and 1972). The present sample thus consists of all employed, and therefore must also be compared with the published information for the employed. This concept is narrower than that of the experienced labor force, for it excludes the unemployed and members of the armed forces.

The only adjustment that was made with the employed concerned those persons with work status not reported who in 1970 were allocated to the industry groups. These individuals had to be excluded from the present sample and therefore must be subtracted from the published figures. The following listing shows the size of the sample (multiplied by 100) and the number of the employed in 1960 and 1970 as given in the Subject Reports of the 1960 and 1970 censuses, Industrial Characteristics, Tables 2 and 32, respectively (U.S. Bureau of the Census, 1967 and 1973).

	1960	1970
Published data	64,646,563	76,805,171
-persons that were allocated	----------	-4,874,838
Subtotal	64,646,563	71,930,333
1/100 sample (x 100)	64,384,100	71,928,700
Difference	- 262,263	- 1,633
Difference as percent of 1/100 sample	-.00407	-.00002

BEST COPY AVAILABLE

Although it can be seen that the difference between the sample and the published data was much larger in 1960 than in 1970, the 1960 difference is negligible as a proportion of the total sample. We therefore conclude that the site of our sample is comparable with the information from published census sources.

Appendix B

ALLOCATION OF INDUSTRIES

The following listings show how the industries as reported in the 1960 and 1970 Public Use Samples were aggregated to yield the 37 industries used in this study. The numbers refer, respectively, to those given in the 1960 and 1970 Description and Technical Documentation of the samples (U.S. Bureau of the Census, 1971; 1972) that were used in making up the work tapes.

1960 Allocation

1. Agriculture: 016, 027-028
2. Mining: 047-049, 057
3. Construction: 066
4. Food: 268-269, 278-279, 287-289, 297-299
5. Textile: 307-309, 317-319, 327
6. Metal: 139, 147, 149, 157-158, 166, 169
7. Machinery: 176, 178, 186, 206, 219, 227-228, 236
8. Chemical: 346, 349, 357, 359, 377-378
9. Miscellaneous Manufacturing: 107-109, 118-119, 127-128, 137-138, 246, 248-249, 259, 328-329, 337-339, 379, 387-389, 397-398
10. Utilities: 467-469, 477-479
11. Transportation: 407-409, 417-419, 427-429
12. Communication: 447-449

Appendix D

ALLOCATION OF OCCUPATIONS

By and large, we have used the same one-digit occupational categories as given in the 1960 and 1970 Technical Description and Documentation of the Public Use Samples (U.S. Bureau of the Census, 1971; 1972). For both years, private household workers were included in the category service workers. In 1970, transport equipment operatives were combined with operatives to make the categories comparable with the 1960 divisions. The only major change that we made was the differentiation of professionals into: (a) professionals and (b) semi-professionals. The following listing contains the Public Use Sample codes for these two occupational categories.

1960

Professionals:	000, 012-014, 020-022, 030-032, 034-035, 040-043, 045, 050-054, 060, 071, 080-085, 090-093, 101-102, 105, 111, 130-135, 140, 145, 150, 152-154, 160, 162, 172-175, 182-184, 194
Semi-Professionals:	010, 015, 023, 070, 072-075, 103-104, 120, 151, 161, 163-165, 170-171, 180-181, 185, 190-193, 195

1970

Professionals:	001-002, 006, 010-015, 020-024, 030-036, 042-045, 051-056, 061-065, 071-073, 075, 091-096, 102-105, 110-116, 120-126, 130-135, 140, 142, 144-145, 163, 170, 181, 194
Semi-Professionals:	003-005, 025-026, 074, 076, 080-086, 090, 100-101, 141, 143, 150-156, 161-162, 164-165, 171-175, 180, 182-185, 190-193, 195

ACCESSION NUMBER: VT103377

TITLE: A PROJECT TO DETERMINE TEACHING CONTENT. FINAL REPORT.

DESCRIPTORS: VOCATIONAL EDUCATION; *VOCATIONAL DIRECTORS; ADMINISTRATOR EDUCATION; *TASK ANALYSIS; *SURVEYS; *ADMINISTRATOR ATTITUDES; CONFERENCES; *ADMINISTRATIVE PERSONNEL

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 113P.

ABSTRACT: THE PURPOSES OF THIS STUDY WERE TO IDENTIFY SPECIFIC TASKS PERFORMED AND INFORMATION NEEDED BY VOCATIONAL EDUCATION ADMINISTRATIVE PERSONNEL IN TENNESSEE AND TO EXPLORE INNOVATIVE APPROACHES FOR UTILIZING THIS INFORMATION IN STAFF DEVELOPMENT ACTIVITIES. EACH OF THE THREE ADMINISTRATOR GROUPS PARTICIPATED IN A CONFERENCE TO IDENTIFY TASKS PERFORMED AND INFORMATION NEEDED FOR VOCATIONAL ADMINISTRATORS. THE RESULTANT LIST WAS MAILED TO ALL MEMBERS OF EACH APPROPRIATE GROUP IN TENNESSEE WHO WERE TO RATE THE ITEMS IN TERMS OF IMPORTANCE AND FREQUENCY OF PERFORMANCE. THE REPORT DESCRIBES THE PROCEDURES UTILIZED IN DEVELOPING THE LISTS. PRESENTS THE LISTS AND RELATED INFORMATION IDENTIFIED FOR EACH OF THE THREE ADMINISTRATIVE GROUPS, AND SUMMARIZES THE REACTIONS OF VOCATIONAL ADMINISTRATORS THROUGHOUT TENNESSEE WITH REGARD TO THE IMPORTANCE AND FREQUENCY OF PERFORMANCE OF EACH TASK OR ITEM OF INFORMATION. THE REPORT ALSO DESCRIBES THE CONFERENCE CONDUCTED TO DEVELOP METHODS FOR TRAINING NEW VOCATIONAL ADMINISTRATORS AND EXISTING PERSONNEL, UTILIZING THE NEWLY ACQUIRED INFORMATION FROM THE PREVIOUS CONFERENCE AND SURVEY. ONE-HALF OF THE REPORT CONSISTS OF APPENDICES CONTAINING LISTS OF CONFERENCE PARTICIPANTS, CONFERENCE AND SURVEY RELATED MATERIALS, SAMPLE SURVEY FORMS, AND CONFERENCE EVALUATION FORMS. (NJ)

SECTION I

INTRODUCTION

Rationale

Continued expansion of vocational and technical education has resulted in the need for additional supervisory and administrative personnel. In addition to the need for new personnel, ways and means of upgrading personnel are needed. These positions include local directors of vocational education, assistant principals and principals in charge of vocational education in comprehensive high schools, administrators of vocational education centers, superintendents and assistant superintendents of area vocational-technical schools, regional and state supervisors, and administrative personnel in community colleges and technical institutes.

It is recognized that there are various related programs offered by colleges and universities including education administration, business administration, and vocational education administration and supervision. These programs, however, are offered in the traditional manner, comprehensive in nature, and there is question whether they are designed to adequately prepare vocational education administrative and supervisory personnel to perform effectively and efficiently in highly specialized positions.

Purpose of the Project

The purpose of this project was twofold: (1) to identify specific tasks performed and items of information needed by vocational education

personnel in various administrative and supervisory positions in Tennessee, (2) to explore innovative approaches in the utilization of this information to train new vocational administrators and upgrade existing personnel. The three administrative areas of concern were superintendents of area vocational-technical schools, assistant superintendents of area vocational-technical schools, and regional supervisors of vocational education. Local directors of vocational education were not included in this project because the desired data had already been obtained through a project conducted by the University of Tennessee.[1]

Methodolgy

A conference, composed of from 12 to 15 experienced administrators and led by a conference leader experienced in utilizing the conference method, was conducted for each of the three administrative groups. The purpose of each conference was to identify the tasks performed and information needed by persons employed in the administrative position represented by the members of that conference.

At the conclusion of each conference a list of the data obtained during the conference was mailed to all of the members of each appropriate administrative group in the State of Tennessee. That is, all superintendents of area vocational-technical schools were mailed the tasks and information identified as a result of the conference composed of area vocational-technical school superintendents, all assistant superintendents were mailed the tasks and information identified in the

assistant superintendents' conference, and all regional supervisors of vocational education were mailed the data resulting from the regional supervisors' conference. Each administrator was then asked to rate each item in terms of importance and the frequency with which it is performed. A more detailed account of the methodology as well as the results of the survey may be found in subsequent sections of this report.

Definitions

Area Vocational School ". . . . vocational school used exclusively or principally for the provision of vocational education to persons who have completed or left school and who are available for study in preparation for entering the labor market."[2]

Assistant Superintendents of Area Vocational-Technical Schools. They are directly responsible to the director and in his absence assume the responsibility of the Superintendent. They supervise the instructors, may serve as coordinator of the evening program and assist the director in planning, organizing, and directing the instructional programs. They shall perform such other duties as may be assigned by the appropriate school head."[3]

Directors (Superintendents of Area Vocational-Technical Schools). They shall direct and/or supervise all programs conducted within the school to which assigned. They shall be responsible for making surveys,

evaluation and improvement. They shall also maintain close contact with business and industry in the area served by the school, in order for the instruction to be suited to the needs and in order to keep up to date on employment opportunities and manpower requirements."[4]

Regional Supervisors of Vocational Education. "(Agricultural Education, Distributive Education, Health Occupations Education, Trade and Industrial Education, Home Economics Education, Vocational Office Education, Industrial Arts Education, Office Occupations). Each Specialist I shall be responsible to the appropriate Chief, Director and/or Specialist II as indicated in the organizational chart. Their primary responsibility is to provide the necessary supervision of programs, services, and activities organized and conducted under the provisions of the State Plan. Specialist I shall also perform such other duties as may be assigned by their administrative unit or section head."[5]

Organization

The remainder of this report is organized as follows. Section II describes the procedures utilized in developing the lists of administrative tasks and items of information. This material is then analyzed in Section III. Included in this section is a list of the tasks and information for each of the three administrative groups as well as the rating of each item in relative importance and frequency of performance. Section IV describes the conference which was conducted in an effort to utilize the newly acquired information for the purpose of training new administrators

---

[4]Ibid., p. 15.

[5]Ibid., pp. 6-7.

and upgrading existing personnel. The final section reviews the project and makes recommendations for future use of the material.

SECTION II

DATA COLLECTION PROCEDURES

Introduction

Three small group conferences were conducted in an effort to identify a list of the tasks performed and the related information required of superintendents of area vocational-technical schools, assistant superintendents of area vocational-technical schools, and regional supervisors of vocational education. The conference participants were selected by state staff personnel on the basis of their experience in their respective fields of work. Conference leaders were selected on the basis of their experience with the conference leading technique.

Upon the completion of each conference, the resulting lists of tasks and related information were verified through rating scales mailed to all of the appropriate administrators in Tennessee. A more detailed discussion of the procedures utilized for each administrative group follows.

Superintendents of Area Vocational-Technical Schools

Mr. Charlie M. Dunn, project director, arranged for a two-day conference conducted by Dr. S. B. Keathley on October 8 and 9, 1974, at the Ramada Inn in Murfreesboro, Tennessee. A sample letter of invitation, a copy of the agenda, and a list of the 12 superintendents of area vocational-technical schools who participated in the conference may be found in Appendix A. As a result of the conference, 19 areas

of responsibility and 66 specific activities relating to those responsibilities were identified and listed.

This data was then put in an appropriate form and mailed to all of the 26 superintendents of area vocational-technical schools in Tennessee. Each superintendent was asked to rate the relative importance of each activity by checking one of five categories. The five categories were: great importance, much importance, some importance, little importance, and no importance. In addition, they were asked to identify the frequency with which each activity was performed by checking one of four categories. The four categories were: frequently, occasionally, seldom, and never. The superintendents were also encouraged to add and rate additional activities which they felt had been omitted from the list. Finally, the superintendents were asked to place each of the 66 activities in one of the 19 general areas of responsibility. However, there was very little agreement on behalf of the administrators with regard to the category in which each task belonged; and, as a result, this information was discarded. A copy of the first page of the three rating forms as well as the accompanying memorandum may be found in Appendix B.

Twenty-four of the 26 superintendents, or 92 percent, completed and returned their surveys. One school was in the process of changing administrations, and both the incoming and outgoing superintendnets returned the survey resulting in a total of 25 respondants. Their names and addresses may be found in Appendix C. The results of their reactions are described in the next section of this report. When contacted during the follow-up, the two who did not return their survey replied that they had not received a copy of the instrument.

Assistant Superintendents of Area Vocational-Technical Schools

On April 22 and 23, 1975, Mr. Charlie M. Dunn conducted a two-day conference at the Ramada Inn in Murfreesboro, Tennessee. A sample letter of invitation, a copy of the agenda, and a list of the 11 assistant superintendents of area vocational-technical schools who participated in the conference may be found in Appendix D. As a result of the conference, 11 general areas of responsibility were identified. The specific activities relating to each of the eleven general areas of responsibility were also identified. This resulted in a total of 135 different supervisory activities.

This data was then put in an appropriate form and mailed to all of the 34 assistant superintendents of area vocational-technical schools in Tennessee. Each assistant superintendent was asked to rate the relative importance of each activity by checking one of five categories and the frequency by checking one of four categories in the same manner the superintendents had. Again, participants in the survey were encouraged to identify and rate additional activities which they felt had been omitted from the list. Because the members of the conference had already classified each activity within a broad area of responsibility, the need for this step was eliminated. A copy of the first page of the two rating forms as well as accompanying memorandum may be found in Appendix E.

One hundred percent of the 34 assistant superintendents returned their surveys. A list of their names and addresses may be found in Appendix F. The results of their reactions are presented in the next section of this report.

Regional Supervisors of Vocational Education

Dr. S. B. Keathley conducted a two-day conference on June 23 and 24, 1975, at Middle Tennessee State University. A sample letter of invitation, a copy of the agenda, and a list of the twelve regional supervisors who participated in the conference may be found in Appendix G. As a result of the conference, 52 activities of regional supervisors of vocational education were identified.

This data was then put in appropriate form and mailed to all of the 29 regional supervisors of vocational education in Tennessee. Each regional supervisor was asked to rate the relative importance of the activity by checking one of five categories and the frequency with which the activity is performed by checking one of four categories. The categories were identical to those used in the superintendent and assistant superintendent surveys. Area supervisors were also encouraged to identify and rate additional activities which they felt had been omitted from the list. No attempt was made to place the activities in general categories of responsibility. A copy of the first pages of the two rating forms as well as the accompanying memorandum may be found in Appendix H.

One hundred percent of the 29 area supervisors returned their surveys. A list of their names and addresses may be found in Appendix I. The results of their reactions are presented in the next section of this report.

Summary

Selected superintendents of area vocational-technical schools, assistant superintendents of area vocational-technical schools, and

area supervisors of vocational education participated in small group conferences in an attempt to identify the tasks and related information required of the respective positions. These lists of tasks were verified, and the relative importance of each task and the frequency of performance was determined through a mail survey of the appropriate vocational administrators in Tennessee. The results of these surveys may be found in the next section of this report.

SECTION III

TASKS AND ITEMS OF INFORMATION

The primary objective of this project was to identify the specific tasks performed and the items of related information required of superintendents of area vocational-technical schools, assistant superintendents of area vocational-technical schools, and regional supervisors of vocational education. This section lists the tasks and related information identified for each of the three administrative groups and summarizes the reactions of vocational administrators throughout Tennessee with regard to the importance and frequency of performance of each task or item of information. The reactions are the result of the mail survey described in Section II of this report.

The information is summarized in the three tables which follow. One table is provided for each of the three administrative groups. In each table, the tasks or information topics are listed in the order of their importance. The order of importance was determined by assigning a value of 5, 4, 3, 2, or 1 respectively to the possible administrative ratings of great importance, much importance, some importance, little importance, or no importance. The mean of the administrators' rating for each task was then calculated to determine their rank order. The number of no responses for each item was recorded in the tables. However, they were not utilized in the calculation of the mean ratings.

The mean ratings and rank order with respect to the frequency with which each task or item of information is performed or required is also stated in each table. The mean was calculated by assigning a value of 4, 3, 2, and 1 respectively to the possible administrative ratings

of frequently, occasionally, seldom, and never. Again, the number of no responses were indicated but were not utilized in the calculations.

Table I

SECTION IV

VOCATIONAL ADMINISTRATORS CONFERENCE

Introduction

A second goal of this project was to explore innovative approaches in the utilization of the identified tasks and related information to train new vocational administrators and upgrade existing personnel. To explore all the possibilities for the utilization of this material would, of course, be beyond the scope of this project. However, a one-week conference was held from August 4-8, 1975, in an effort to explore one possibility in the utilization of this material. The purpose of the conference was to assist present vocational school administrators to improve their administrative and supervisory capabilities and to provide new administrators with the background necessary for assuming their duties in the fall. Area vocational-technical school administrators and selected administrators, directors and/or coordinators of vocational high schools or departments from throughout the State of Tennessee were invited to attend.

Pre-Conference Activities

Dr. James Lorenz, director of the conference, was employed three weeks prior to the beginning of the conference to prepare for the conference. Several meetings were held prior to and during this period with Dr. Lorenz and Mr. Charlie M. Dunn, Director of Vocational-Technical Education at MTSU, for the purpose of developing plans for the conference. At this time, meetings were also held with Mr. H. D. Jared and

Mr. Maurice Jackson of the Tennessee Division of Vocational-Technical Education for the purpose of receiving their input in the selection of conference participants and in the design and selection of conference activities.

In addition to planning for the conference, materials were developed for utilization in the conference. These included an annotated bibliography on the administration and supervision of vocational-technical education, a list of vocational material at the Middle Tennessee State University library, a series of daily conference evaluation forms, and administrative case studies. Arrangements were also made to offer university credit for those conference participants desiring it, for facilities to house the conference, and for housing for the conference participants at both on and off campus locations. During this period considerable time and care were taken in the selection and notification of individuals who were to make presentations at the conference. Finally, several mailings were prepared for the notification and confirmation of potential conference participants.

Conference Participants

As stated earlier, the conference was designed to be of interest to two broad classifications of vocational administrators: those who were currently serving vocational education in some administrative capacity and those who were to assume their duties in the fall of 1975. Therefore, a list of possible participants was developed; and invitations were mailed to the administrators of all 26 Tennessee area vocational-technical schools and 34 county superintendents of schools in Tennessee. The county superintendents of schools were asked to

forward the invitation to the appropriate administrator in their county. As a result, ten superintendents of area vocational-technical schools, an assistant superintendent of an area vocational school, a county vocational director, a county superintendent of schools, a director of a vocational high school, and a principal of an elementary school accepted the invitation to attend the conference. A list of the names and addresses of the 15 conference participants may be found in Appendix J. The relatively small turn out may have been due in part to the fact that due to a delay in the final approval of the project invitations were not mailed until July 17, just two and one-half weeks before the start of the conference. There were advantages to having a small group, however, because newly developed materials were presented and careful evaluation was essential. Prior to the start of the conference, each of the participants was mailed a letter of welcome and a conference agenda to aid in their preparation for the conference.

Facilities

The conference was held in the University Center of Middle Tennessee State University. Three rooms were utilized for both large and small group work. The facility also houses a bookstore, post office, and restaurant for the convenience of the participants. Housing was made available both on campus in university dormitories and at nearby motels.

Conference Activities

The conference was designed so as to utilize the previously developed tasks and related information in an effective and interesting

manner. The first step was to take the 66 tasks identified by superintendents of area vocational-technical schools and group them for effective presentations, small and large group work. Experienced administrators and state personnel, along with the classification of the task statements by the superintendents responding to the survey, were used for this purpose. The task lists for assistant superintendents and area supervisors had not been completed at this time and as a result were not used. This grouping resulted in the selection of the general categories of Administration and Supervision, Program Planning and Organization, Public Relations, Placement and Follow-up, Evaluation, and Professional Improvement. Appropriate topics for presentations and for large and small group work were then identified for each of these categories. Finally, individuals were chosen to make presentations for the appropriate topics. In an effort to make the conference as meaningful as possible, only individuals currently practicing as administrators who had demonstrated competence in the chosen topic were selected to make presentations. A copy of the agenda prepared for the participants as well as a list of the names and addresses of conference presenters may be found in Appendix K.

A brief description of each of the ten sessions follows:

Session 1, Monday, August 4, 8:00 a.m. - 12:00 noon. Session 1 was designed as an organizational meeting for all participants. Time was devoted to registration for the conference and registration for university credit for the four of the fifteen participants who desired it. Certificates of attendance were awarded by the Middle Tennessee State University Office of Continuing Education to those individuals not desiring university credit. Registration was followed by an overview of the

conference presented by Mr. Charlie M. Dunn. During this presentation, conference goals and objectives were clarified. Finally, time was allotted for a get-acquainted session.

Session 2, Monday, August 4, 1:00 p.m. - 4:30 p.m. The afternoon session began with a welcome by Dr. E. S. Voorhies, Dean of the School of Basic and Applied Sciences, and Dr. Jack Carlton, Vice President for Academic Affairs. Mr. Edward L. Weld, Director, Nashville State Technical Institute followed the welcoming remarks with a presentation on the effective use of advisory committees. The session closed with a presentation by Dr. S. B. Keathley on the principles of administration and supervision. Questions and reactions by the participants were encouraged during and after each presentation.

Session 3, Tuesday, August 5, 8:00 a.m. - 12:00 noon. As a follow-up of Dr. Keathley's presentation the previous day, this session began with a large group meeting in which the entire group identified some major concerns or problems involving the administration and supervision of vocational education. The large group was then divided into three smaller groups, with each group brainstorming solutions to several of the identified problems. The session concluded with a large group meeting involving presentations and discussions concerning the various problems and their solutions.

Session 4, Tuesday, August 5, 1:00 p.m. - 4:30 p.m. Highlighting the fourth session were presentations by Mr. H. D. Jared, Director of Field Services and Mr. Maurice Jackson, Director of State Area Vocational-Technical Schools of the Division of Vocational-Technical Education. Mr. Jared and Mr. Jackson discussed the various state services which are available through their respective offices. Time was allotted for questions and answers.

The remainder of the session was spent in planning for a mock advisory committee meeting to be held on Thursday afternoon. An assignment sheet with suggested guidelines was provided for this purpose. It had been decided that role playing the planning and conducting of such a meeting would be an ideal way to apply and reinforce some of the ideas presented by Mr. Weld during the second session.

Session 5, Wednesday, August 6, 8:00 a.m. - 12:00 noon. Mr. Tom Hinson, Director of Fiscal Affairs of the State Division of Vocational Education, opened the fifth session with a presentation on state budgetary policies and procedures. Mr. Dean Ward, Superintendent of Hartsville State Area Vocational-Technical School and one of the conference participants, concluded the topic of budgeting with a presentation entitled "Institutional Budgeting and Management". "Utilizing Community Resources" was the final topic of the morning session. Mr. James Pierce, Superintendent of Tri-Cities Area Vocational-Technical School discussed a variety of principles and ideas for administering this very important area.

Session 6, Wednesday, August 6, 1:00 p.m. - 4:30 p.m. McKenzie State Area Vocational-Technical School Superintendent, Mr. Guy R. Kirk, opened the afternoon session with a presentation on the supervision of instruction. The question and answer period which followed Mr. Kirk's presentation indicated a great deal of interest in this area. In an effort to sustain this interest, the participants were divided into three small groups with each group being asked to react to several different case studies involving administration and supervision. The small group reactions were then presented to the total group at the conclusion of the afternoon session.

Session 7, Thursday, August 7, 8:00 a.m. - 12:00 noon. Mrs. Dee Wilder began the seventh session with a presentation on the materials and services available through the Tennessee Research Coordinating Unit. After a short break, Ms. Martha Henegar, Director of Public Relations at Nashville State Technical Institute, presented a variety of ideas on the use of effective public relations activities.

Session 8, Thursday, August 7, 1:00 p.m. - 4:30 p.m. At this time, the participants decided there was a need to clarify and restate the problems originally discussed during the third session so that they could be brought to the attention of the appropriate personnel for action. A list of the concerns stated by the participants using the conference technique may be found in Table IV.

The participants concluded the session by role playing an advisory committee meeting. Mr. Dunn and Dr. Keathley reacted to the role playing and a discussion followed.

Session 9, Friday, August 8, 8:00 a.m. - 1:00 p.m. Mr. Paul Robertson, Specialist II in Curriculum Development for Area Vocational Technical Schools, began the final session with a discussion of the State Record System of Enrollment, Placement and Follow-up. A related topic was presented by Mr. Ralph Brown, Research Assistant for the Research Coordinating Unit, in discussion the State Record System for Secondary Schools.

Following a short break, Mr. William Harrison, Executive Director of the State Advisory Council on Vocational Education, made a presentation on instructional program evaluation. Mr. Robert Evans of the Tennessee Division of Vocational-Technical Education concluded the morning session with a presentation on institutional self-study and

TABLE IV

12. The need for communication between the State Board and administrators.	X	X
13. Defining the responsibilities of state supervisors.	X	X

accreditation as related to state area vocational-technical schools. The final presenter was unable to attend the afternoon session so the conference participants turned their attention to a final evaluation of the conference. A discussion of the evaluation procedures and results for each session as well as the conference as a whole follows.

Evaluation

From the outset, both formative and summative evaluations were considered essential. In order to obtain information during the process of the conference which might influence subsequent sessions, a simple form (see figure 1) was devised which the participants were asked to complete at the end of each session. The form varied slightly from day to day depending on the topic or topics covered. A summary of each day's ratings and comments may be found in Appendix L.

Figure 1

SESSION NUMBER 6 SUPERVISION OF INSTRUCTION

Overall, this session was:

_____ excellent _____ very good _____ good _____fair_____ good

Comments:

In my present position, the material presented during this session will be:

_____ very useful _____ somewhat useful _____ not useful

Comments:

Up to this point, has the conference lived up to your expectations?

_____ yes _____ no _____ undecided

If no or undecided, what suggestions do you have for improving the conference?

In addition, daily informal discussions were held to ascertain the reactions of the participants to specific parts of the programs. The results of these written and oral communications were quite encouraging; and when feasible, changes in the program were made as a result of this information.

During the evaluation on the final day of the conference, the participants were divided into three small groups and asked to react to each of the following questions or statements in the absence of the conference director. Wh .eatures of the conference did you like best? What features did you like least? Briefly evaluate the conference. What suggestions do you have for improving future conferences of this nature?

The features liked most about the conference were:

* Relevant problems covered.
* Individual participation.
* The identification of the twelve concerns and a promise of a follow-up on these.
* Flexibility allowed for individual input.
* Cross-section of consultants and subject areas.
* Time provided participants to express their concern.

The features liked least about the conference were:

* Cold rooms (two groups made this comment).
* Sitting too long.
* Too many individual administrative problems brought up.
* Too much time on Research Coordinating Unit.

In briefly evaluating the conference, two groups rated it excellent; and one group rated it very good. The following suggestions were made for improving future conferences of this type:

* Bring this type of conference to different parts of the state.
* Have this type of conference for assistant superintendents and counselors.
* More time to discuss the results of group conferences.
* Six hour day.
* Wider variety of participants such as local directors, principals, comprehensive personnel.
* More pre-planning by participants in order to provide consultants with advance concerns so that their presentations could be keyed to these concerns.

Summary

A vocational administrators conference was held from August 4-8, 1975, for the purpose of assisting present vocational school administrators in improving their administrative and supervisory capabilities and to provide new administrators with the background necessary for assuming their duties this fall. The director of the conference, Dr. James Lorenz, was employed for a period of three weeks prior to the beginning of the conference. His duties during this period included planning sessions with university, local, and state personnel, developing materials to be utilized in the workshop, selecting and notifying potential participants, and securing the necessary facilities. The workshop itself was designed to utilize the previously developed tasks and related information. An informal format was chosen for the conference in which practicing administrators conducted sessions on selected topics. The results of both the formative and summative evaluations indicated that the conference had been a valuable experience for all concerned.

SECTION V

SUMMARY AND RECOMMENDATIONS

Summary

Continued expansion of vocational and technical education has resulted in the need for additional administrative and supervisory personnel, as well as ways and means of upgrading existing personnel. As a first step in meeting this demand, this project was designed to systematically identify the tasks and items of related information required of superintendents of area vocational-technical schools, assistant superintendents of area vocational-technical schools, and regional supervisors of vocational education. A second major goal of this project was to explore innovative ways to utilize the information gathered in phase one of the project.

Initially, selected administrators from each of the three administrative groups met in separate conferences for the purpose of identifying the tasks and items of related information considered to be essential to their respective positions. The information obtained from each group was then mailed to all administrators in the State of Tennessee within that particular group for the purpose of identifying the relative importance of each task or bit of information as well as the frequency with which it was performed. Phase one of this project was completed with the tabulation of the results of the three surveys.

The exploration of a large number of possibilities for the utilization of this material was beyond the scope of this project.

However, a one-week conference was held from August 4-8, 1975, for the purpose of assisting present vocational school administrators in improving their administrative skills and to provide new administrators with the background necessary for assuming their duties in the fall. Fifteen vocational administrators representing both area vocational-technical schools and local systems participated in a variety of activities organized around the topics of program planning and organization, public relations, placement and follow-up, evaluation, and professional improvement. The conference, which was rated a success by the participants, utilized experienced practicing vocational administrators to conduct each session.

The potential value of this project, however, lies in the continued and imaginative use of the identified administrative tasks and related information. A few possibilities are presented below.

Recommendations

As a result of the type of information and experiences gained from the project, the following recommendations are made for the utilization of this material.

1. To determine which tasks and information topics are peculiar to specific administrative positions.
2. To determine if personnel are performing all tasks required of them or if there are other tasks which should be introduced.
3. To develop plans for self-evaluation.
4. To provide content for up-dating existing curricula for training new personnel.

5. To provide content for up-dating personnel already employed.

6. To provide content for additional inservice and preservice conferences.

Mr. Burton Ingram, Superintendent
Crossville State Area Vocational-Technical School
P. O. Box 725
Crossville, Tennessee 38555

Dear Mr. Ingram:

You are invited to attend and participate in a two-day conference (either in Nashville or Murfreesboro) on Tuesday and Wednesday, October 8 and 9, 1974. Your expenses will be paid by Middle Tennessee State University under a grant provided by the Division of Vocational and Technical Education.

Detailed information on location, motel reservation, and transportation to and from the airport will be sent to you later. A copy of the project proposal is enclosed for your information.

The purpose of the conference is to draw upon your knowledge and experience as a vocational school administrator to determine content for future courses, workshops and programs for administrators and supervisory personnel.

Your acceptance and participation in this conference will be of tremendous value to the continued development of the total program of Vocational-Technical Education in Tennessee. I hope you can attend and request that you let me know by returning the enclosed card by September 6, 1974.

Sincerely yours,

Charlie M. Dunn
Director

MEMORANDUM

TO: Area Vocational-Technical School Superintendents

FROM: Charlie M. Dunn, Director
Vocational-Technical Education
Middle Tennessee State University

SUBJECT: Project - Determining Teaching Content

DATE: March 12, 1975

Under an approved project to determine teaching content for vocational school administrators, twelve superintendents participated in a two-day workshop here at Middle Tennessee State University. This conference was held on October 8 and 9, 1974. The work of that group resulted in identification of twenty functions which are listed in Form 3a of the enclosed material.

A list of sixty-six specific activities have been identified as tasks normally performed by vocational school administrative personnel including local directors of vocational education. These activities are also included in the enclosed material.

I am soliciting your assistance and help in accomplishing the following:

1. Determine the relative importance of each of the sixty-six identified activities. Form 1, consisting of five pages, has been prepared as a check sheet so that you may read each activity and check in the appropriate place its relative importance in the work of a vocational school administrator.

2. It is also of importance to us to determine the frequency of performance of the sixty-six activities. Form 2, consisting of five pages, is to be used as a check sheet to determine the frequency of the listed activities. Simply check in the appropriate space your opinion as to the frequency each of the activities are performed by you as an administrator.

3. The third and final request is that you review the twenty functions which are listed on Form 3a with an assigned function number. Using this listing as a reference list, please enter the number of the appropriate function on Form 3b so as to classify each of the activities by function. As an example, on Form 3b, item 3 identifies the activity to promote and demonstrate good public relations. You are requested to enter the appropriate function number under which this activity should be listed.

I realize that this will take some time, but I also feel that it is of importance to the development of appropriate courses, workshops, conferences, and other activities for the further development of administrative personnel. Your fellow superintendents who participated in the two-day conference contributed in a very fine way to this project, and you have the opportunity now of helping complete it so the material may be put to use for the above stated purpose.

I would appreciate receiving your response by Tuesday, April 1, 1975. Thanking you in advance for your cooperation.

MIDDLE TENNESSEE STATE UNIVERSITY

MURFREESBORO, TENNESSEE 37130

OFFICE OF VOCATIONAL TECHNICAL EDUCATION TELEPHONE (615) 898 2611

MEMORANDUM

TO: Regional Supervisors of Vocational-Technical Education

FROM: Charlie M. Dunn, Director
Vocational-Technical Education
Middle Tennessee State University

SUBJECT: Project - Determining Teaching Content

DATE: July 7, 1975

Under an approved project to determine teaching content for regional supervisors of vocational education, twelve regional supervisors participated in a two-day workshop here in Murfreesboro. This conference was held on June 24 and 25, 1975. The work of that group resulted in identification of some 52 specific activities. The list of 52 activities has been identified as tasks normally performed by regional supervisors.

I am soliciting your assistance and help in accomplishing the following:

1. Determine the relative importance of each of the 52 identified activities. Form I has been prepared as a check sheet so that you may read each activity and check in the appropriate place its relative importance in the work of a regional supervisor.

2. It is also of importance to us to determine the frequency of performance of the 52 activities. Form II is to be used as a check sheet to determine the frequency of performance of listed activities. Simply check in the appropriate space your opinion as to the frequency each of the activities are performed by you as a supervisor.

I realize that this will take some time, but I also feel that it is of importance to the development of appropriate courses, workshops, conferences, and other activities for the further development of supervisory personnel. Your fellow workers who participated in the two-day conference contributed in a very fine way to this project, and you have the opportunity now of helping complete it so that the material may be put to use for the above stated purpose.

I would appreciate receiving your response by August 4, 1975. Thanking you in advance for your cooperation.

mh

VOCATIONAL REGIONAL SUPERVISOR SURVEY

Relative Importance of Activities

The regional supervisor of vocational-technical education in Tennessee is employed by the State Board for Vocational-Technical Education. The primary purpose of this person is to provide leadership and services to local education agencies that will maintain and improve instruction of vocational-technical programs.

The vocational supervisor is vitally concerned with personnel development and teacher certification; curriculum development, planning, organizing, and implementing vocational programs and facilities; vocational student organization; and evaluation.

Specific activities relating to these areas are:

Activities	Importance	Great Importance	Much Importance	Some Importance	Little Importance	No Importance
1. Assist with the planning, organizing, and implementing of vocational programs according to the provisions of the Tennessee State Plan for Vocational Education.						
2. Work with local, state, and national personnel in organizing and developing vocational student organizations and activities.						
3. Assist local administrators and instructional personnel with the interpretation of the rules, regulations, and minimum standards of the State Board for Vocational Education.						
4. Give assistance in the promotion and organization of local advisory committees.						

VOCATIONAL REGIONAL SUPERVISOR SURVEY

Frequency of Performance of Activities

Activities	Activity is Performed	Frequently	Occasionally	Seldom	Never
1. Assist with the planning, organizing, and implementing of vocational programs according to the provisions of the Tennessee State Plan for Vocational Education.					
2. Work with local, state, and national personnel in organizing and developing vocational student organizations and activities.					
3. Assist local administrators and instructional personnel with the interpretat n of the rules, regulations, and minimum standards of the State Board for Vocational Education.					
4. Give assistance in the promotion and organization of local advisory committees.					
5. Orient local administrators, supervisors, and guidance counselors to the purpose of the program.					
6. Assist local and state agencies in determining the vocational student needs and manpower training requirements.					
7. Prepare curriculum guides and other curriculum aids for various subjects and grade levels.					
8. Interpret and clarify teacher certification requirements for vocational personnel.					
9. Establish a functional relationship with other groups in and out of schools.					
10. Assist local administrators in developing local contracts, proposals, and grants.					
11. Develop and disseminate instructional materials.					
12. Consult with teacher educators in identifying materials, methods, techniques, and procedures for successful teaching.

VOCATIONAL SCHOOL ADMINISTRATORS CONFERENCE

AGENDA AND PRESENTERS

VOCATIONAL SCHOOL ADMINISTRATORS CONFERENCE

August 4-8, 1975

A G E N D A

Monday, August 4

8:00 a.m. - 12:00 Noon FIRST SESSION Dr. James Lorenz, Chairman

Conference Overview: Mr. Charlie M. Dunn, Director, Vocational Education, Middle Tennessee State University

9:00 a.m. Organizational Meeting of All Participants

12:00 Noon - 1:00 p.m. LUNCH

1:00 p.m. - 4:30 p.m. SECOND SESSION Dr. James Lorenz, Chairman

Welcome: Dr. E. S. Voorhies, Dean of the School of Basic and Applied Sciences

Dr. Jack Carlton, Vice President for Academic Affairs

Remarks: Mr. Jonah Fitch, Assistant Commissioner for Vocational-Technical Education

Effective Use of a General Advisory Committee, Mr. Edward L. Weld, Director, Nashville State Technical Institute

Break 2:45 - 3:00 p.m.

ADMINISTRATION AND SUPERVISION

Principles of Administration and Supervision, Dr. S. B. Keathley

Questions and Answers

Group Identification of Administrative and Supervision Problems

ADJOURN

NOTES:

Tuesday, August 5

8:00 a.m. - 12:00 Noon THIRD SESSION

ADMINISTRATION AND SUPERVISION (Continued)

Problem Solving (Small Group)

Small Group Reports

Break 10:00 - 10:15 a.m.

Group Planning for an Advisory Committee Meeting, Dr. James Lorenz

12:00 Noon - 1:00 p.m. LUNCH

1:00 p.m. - 4:30 p.m. FOURTH SESSION

PLANNING AND ORGANIZATION

Program Development

Break 2:45 - 3:00 p.m.

ADMINISTRATION AND SUPERVISION (Continued)

States Services, Mr. H. D. Jared, Coordinator, Field Services.
Mr. Maurice Jackson, Director, State Area Vocational-Technical Schools

Questions and Answers

ADJOURN

NOTES:

Wednesday, August 6

8:00 a.m. - 12:00 Noon FIFTH SESSION

ADMINISTRATION AND SUPERVISION (Continued)

State Budgeting Policies and Procedures, Mr. Tom Hinson, Director, Fiscal Affairs, State Division of Vocational Education

Institutional Budgeting and Management, Mr. Dean Ward, Superintendent, Hartsville State Area Vocational-Technical School

Break 10:00 - 10:15 a.m.

PLANNING AND ORGANIZATION (Continued)

Utilizing Community Resources, Mr. James Pierce, Superintendent, Tri-Cities State Area Vocational-Technical School

Discussion

12:00 Noon - 1:00 p.m. LUNCH

1:00 p.m. - 4:30 p.m. SIXTH SESSION

ADMINISTRATION AND SUPERVISION (Continued)

Supervision of Instruction, Mr. Guy R. Kirk, Superintendent, McKenzie State Area Vocational-Technical School

Discussion

Break 2:45 - 3:00 p.m.

Case Studies, Dr. James Lorenz

ADJOURN

NOTES:

Thursday, August 7

8:00 a.m. - 12:00 Noon SEVENTH SESSION

ADMINISTRATION AND SUPERVISION (Continued)

Research Coordinating Unit--Materials and Services, Mrs. Dee Wilder, Information Specialist, RCU

Instructional Materials, Dr. James Lorenz, and Mr. Charlie M. Dunn

Reactors

Break 10:00 - 10:15 a.m.

PUBLIC RELATIONS

Effective Public Relations Activities, Ms. Martha Henegar, Director of Public Relations, Nashville State Technical Institute

Group Planning of a Timetable for a Public Relations Program

12:00 Noon - 1:00 p.m. LUNCH

1:00 p.m. - 4:30 p.m. EIGHTH SESSION

PLANNING SESSION

Group Planning for an Advisory Committee Meeting

Group Planning of Public Relations Timetable

Break 2:45 - 3:00 p.m.

Advisory Committee Meeting (Role Play)

Critique, Mr. Charlie M. Dunn and Dr. S. B. Keathley

ADJOURN

NOTES:

Friday, August 8

8:00 a.m. - 12:00 Noon NINTH SESSION

PLACEMENT AND FOLLOW-UP

State Record System--Area Vocational-Technical Schools, Mr. Paul Robertson, Specialist II, AV-TS

State Record System--Secondary Schools, Mr. Ralph Brown, Research Assistant, Research Coordinating Unit, and Mrs. Dee Wilder

Questions and Answers

Break 10:00 - 10:15 a.m.

EVALUATION

Instructional Program Evaluation, Mr. William M. Harrison, Executive Director, State Advisory Council

Institutional Self-Study and Accreditation, Mr. Robert Evans, State Area Vocational-Technical Schools

Questions and Answers

12:00 Noon - 1:00 p.m. LUNCH

1:00 p.m. - 4:30 p.m. TENTH SESSION

PROFESSIONAL IMPROVEMENT

Personal Improvement of Administrators and Staff, Dr. R. B. Daniels, Chief, Postsecondary Vocational and Technical Education

Discussion--Reactors

Report of Public Relations Timetable

Break 2:45 - 3:00 p.m.

Conference Evaluation, Dr. James Lorenz

DAILY CONFERENCE EVALUATION FORM SUMMARIES

CONFERENCE EVALUATION FORM

Session Number 1 Conference Overview

Overall, this session was:

Excellent	4
Very Good	5
Good	3
Fair	2
Poor	0

Comments:

Feel that today was organizational.

This session seemed a little slow, however, I don't know how to improve it unless closed scheduling.

The goals and procedures for this conference are:

Very Clear	10
Reasonably Clear	3
Unclear	0

Session Number 2 Introduction to Administration and Supervision

Overall, this session was:

Excellent	5
Very Good	7
Good	2
Fair	0
Poor	0

In my present position, the material presented during this session will be:

Very Useful	11
Somewhat Useful	2
Not Useful	1

Comments:

I will take a new look at my general advisory committee, keeping in mind the information obtained. I feel I will be able to do a better job.

Advisory Council presentation excellent.

Up to this point has the conference lived up to your expectations?

Yes	12
No	1
Undecided	1

If no or undecided what suggestions do you have for improving the conference?

More for local directors.

Session Number 3 Problem Identification and Solving

Overall, this session was:

Excellent	2
Very Good	10
Good	1
Fair	1
Poor	0

Comments:

We have identified several problems but so far no solutions.

In my present position, the material presented during this session will be:

Very Useful	6
Somewhat Useful	7
Not Useful	1

Session Number 4 Group Planning for Advisory Committee Meeting State Services

Overall, this session was:

Excellent	5
Very good	5
Good	2
Fair	1
Poor	0

Comments:

Good, short.

In my present position, the material presented during this session will be:

Very Useful	5
Somewhat Useful	6
Not Useful	1

Up to thir point has the conference lived up to your expectations?

Yes	11
No	1
Undecided	1

If no or undecided what suggestions do you have for improving the conference?

Some attention needs to be addressed toward too much time taken on a single problem

Session Number 5 Budgeting--Community Resources

Overall, this session was:

Excellent	3
Very Good	9
Good	1
Fair	0
Poor	0

Comments:

Presentations by outside speakers good.

In my present position, the material presented during this session will be:

Very Useful	6
Somewhat Useful	7
Not Useful	0

Session Number 6 Supervision of Instruction

Overall, this session was:

Excellent	9
Very Good	2
Good	2
Fair	0
Poor	0

Comments:

Excellent presentation by Mr. Kirk.

In my present position, the material presented during this session will be:

Very Useful	10
Somewhat Useful	2
Not Useful	1

Up to this point has the conference lived up to your expectations?

Yes	12
No	1
Undecided	0

If no or undecided what suggestions do you have for improving the conference?

Some activities that would not require sitting.

Session Number 7 RCU - Public Relations Activities

Overall, this session was:

Excellent	5
Very Good	6
Good	2
Fair	0
Poor	0

Comments:

Questions and answer session best.

In my present position, the material presented during this session will be:

Very Useful	7
Somewhat Useful	5
Not Useful	1

Session Number 8 Group Planning - Advisory Committee Meeting

Overall, this session was:

Excellent	4
Very Good	4
Good	3
Fair	1
Poor	0

Comments:

Needs more control or planning.

In my present position, the material presented during this session will be:

Very Useful	4
Somewhat Useful	7
Not Useful	2

Up to this point has the conference lived up to your expectations?

Yes	11
No	0
Undecided	1

If no or undecided what suggestions do you have for improving the conference?

Jim, you and Mr. Dunn have done an excellent job. I will be in contact with both of you.

Session Number 9 Placement and Follow-up - Evaluation

Overall, this session was:

Excellent	2
Very Good	9
Good	1
Fair	1
Poor	0

In my present position, the material presented during this session will be:

Very Useful	5
Somewhat Useful	7
Not Useful	1

Comments:

Would like for all non-teaching area vocational-technical school professional employees having the opportunity to attend near home a conference such as this.

Did the conference live up to your expectations?

Yes	13
No	0
Undecided	0

What suggestions do you have for improving the conference?

To get out of classroom if could be arranged, long week in one chair.

Tighten up the sessions where there was no control - use time tables or time allowed for delivery.

New administrators perhaps received more help than those who had been on the job for several years. However, I think all of us received information and help that was worth the time and expense involved.

In regard to duties, responsibilities and specific personal concerns, I feel that this conference has been very helpful to me as an AV-TS administrator.

Should be repeated for other individuals.

Comment:

Excellent opportunities existed for input throughout the conference.

Suggestion:

A brief outline of topics in advance would allow participants to bring other local school personnel concerns to the conference.

PREFACE

The purpose of this monograph is to provide direction for those who contemplate establishing a competency-based program for vocational teachers. This document should be of value as a basic resource in the area of competency-based teacher education (CBTE) and serve as a useful tool for CBTE program implementation and improvement.

The content for this publication evolved from the Institute on Competency-Based Teacher Education for Virginia Vocational and Technical Teacher Educators which was conducted in Blacksburg, Virginia, November 23-26, 1975. Major papers developed for this conference as well as two papers developed after the institute was held are included in the sections which follow. This document has been prepared in fulfillment of the objectives of an Educational Professions Development Act grant (EPDA project number 30050 A20) funded by the U. S. Office of Education.

Appreciation is expressed to the following advisory committee members for the guidance they provided to this project:

Mr. Glenn A. Anderson
Assistant Supervisor
Agricultural Education
State Department of Education

Dr. Howard G. Ball
Assistant Professor
Secondary/Post-Secondary Education
Virginia Commonwealth University

Dr. Evelyn Barnes
Associate Professor
Virginia Commonwealth University

Ms. Marguerite Crumley
Associate Director
Division of Vocational Education
State Department of Education

Dr. Vivian Ely, Professor
Secondary/Post-Secondary Education
Virginia Commonwealth University

Dr. Joseph A. Ford, Head
Department of Technology
Norfolk State College

Mr. Thomas A. Hughes, Jr.
Supervisor, Industrial Arts
State Department of Education

Mr. L. M. Jewell, Supervisor
Statistical Services for Vocational Education
State Department of Education

Mr. Carl E. Jorgensen
Supervisor, Business Education Services
State Department of Education

Mr. Wayland H. Jones, Director
Division of Teacher Education
State Department of Education

Mrs. Maggie Nelson
Division of Teacher Education
State Department of Education

Mr. Walter S. Ramey
Professor, Vocational Education
Virginia Commonwealth University

Ms. Marietta Spring
Assistant Professor
Business Education and Office Administration
Old Dominion University

Appreciation is expressed to the many persons involved with the Institute on Competency-Based Teacher Education for Virginia Vocational and Technical Teacher Educators. Special recognition is given to the following individuals for their substantial contributions to this publication:

Dr. Robert Houston
Associate Dean
College of Education
University of Houston

Dr. James B. Hamilton
Program Director
Center for Vocational Education
Ohio State University

Dr. Glenn Fardig
Research and Development Specialist
Ohio State University

Dr. Daniel E. Vogler
Associate Professor and Coordinator of Undergraduate Occupational Teacher Programs
University of Michigan

Dr. Martha Blankenship, Professor
Home Economics Education
Marshall University

Special recognition is also given to Marietta Spring for her support and contribution to this project. Many hours of dedicated work writing letters, editing materials, keeping records, and assisting the project directors contributed greatly to the project's success.

A special thanks are extended to Pam Ayers, Donna Brewer, and Mary Loy for their expertise in secretarial assistance.

THE CHALLENGE OF COMPETENCY-BASED TEACHER EDUCATION

If it were possible to gaze into a "crystal ball" and see teacher education in the year 2001, what would be visualized? Would Competency-Based Teacher Education (CBTE) be seen? If so, the following scenes might be viewed. Current problems involve demonstrating that you are competent as a teacher educator, obtaining your license to perform your role by fulfilling the fitness criteria and competently performing professional tasks. As you pass by the screening device hooked up to the latest model of the WXYZ computer system, you wish you could relive the Seventies, Eighties and Nineties. Accountability was an issue in those days but who believed that it would ever come about? Oh, yes, you remember all of those innovative programs: individualized instruction, behavioral objectives, open education, team teaching, relevant instruction, accountability, and competency-based teacher education. As these new terms came on the educational scene, you tossed them around in your mind for awhile but dismissed them because you figured that they would blow out as quickly as they blew in only with gale wind force.

Behavioral objectives, individualized instruction, criterion referenced measures, student accountability, and the systems approach were one thing, but competency-based teacher education was something else. Entirely! Or was it? Maybe it was a concept that developed out of the earlier education innovations and was spurred on by increasing demands for accountability, relevance, and cost-effective schooling. In those days, technological advances and readiness for competency-based teacher education programs were just emerging. Remember your boast: "The cost is too much; we will never be able to implement it...it's just another education fad."

Of course, you were kidding. After all you implemented it during the Eighties, and now you talk about costs in relation to benefits or effectiveness. Yes, you remember when competency-based education kept you on your toes.

Fantasy aside, take a serious look at competency-based teacher education and the challenge for the future. Today's student will spend more time in the 21st century than in the 20th. Simple arithmetic warns us how close we are to the new century; it is as close as 1952. It is becoming common to say that, given the current rate of knowledge growth, today's 18-year-old college student has access to only three percent of the knowledge that will be available to him/her when he is 50. Confronted with the changing school environment, taking a look at what is happening now leads to a pretty specific conclusion: we may not be taking our needed reformation of teacher education programs and its relationship to the real world of teaching seriously enough.

The movement toward competency- or performance-based teacher education has been inspired by the belief on the part of some individuals that it offers the potential of helping solve many of the problems associated with teacher education. CBTE has been described by some educators as "the most significant lever for educational reform since Sputnik" and as "one of the most influential and important developments in this progressive effort to advance the process of schooling" (Rosner and Kay, 1974). Others refer to it as an "old wine in new bottles," and "a good idea if you could figure out what it is."

Although some individuals may have doubts concerning its effectiveness, much is being discussed and written about competency-based teacher education.

Attempts to operationalize CBTE are increasing as the national movement gains momentum.

RATIONALE AND HISTORY OF COMPETENCY-BASED TEACHER EDUCATION

Competency-based teacher education is a concept that has developed over a number of years (Broudy, 1972; Rosner and Kay, 1974). The competency-based approach to teacher education grew out of dissatisfaction with programs existing in teachers, colleges and colleges of education. Broudy (1972, p. 1) states:

> The dissatisfaction is a fairly old story; the fires of criticism fanned by Bestor, Koerner, Rickover, the Council for Basic Education, and Conant in the late 50's and early 60's leaped higher than ever when fueled by the troubles of urban schools in the late 60's. The public was told that teachers oppressed and murdered children (at least in spirit) and that the public school, like God, was dead.

Efforts were made to combat the problem as it was beginning to be recognized by leaders in the field. Federal funds were invested in a variety of R & D efforts which stimulated recent advances in instructional technology. Both practicing educators and the educational research community were more willing to address themselves more closely to the problems of the classroom. Protocol and training materials were developed and field-tested. Much of the curriculum materials developed were individualized and personalized. These developments led to a focus on education that was more systematic and field-oriented. Instruction was tailored to specific student outcomes, student evaluation and program evaluation passed upon explicit goals.

Rosner and Kay (1974) indicate that competency-based teacher education seems to have been the culmination of all the recent efforts to improve

and upgrade education programs. Many characteristics which have been associated with other recent advancements in instructional technology are also associated with competency-based teacher education.

The dissatisfaction with teacher education by some individuals was attributed to the gap between theory and practice. Teacher education programs were made up largely of academic studies, courses in professional education, and a student teaching experience. This curriculum did not guarantee the output of competent teachers who could successfully teach within the public schools and solve the many problems associated with their role as a classroom teacher. The approach offered through competency-based teacher education would evaluate and more closely guarantee the product, not the input which was supposed to produce the product.

DEFINITION AND CHARACTERISTICS OF COMPETENCY-BASED EDUCATION

A number of definitions of CBTE have been discussed in recent publications (Houston and Howsam, 1972; Finch and Hamilton, 1974; and Brooks, 1974). The most widely quoted and accepted definition was developed by Elam (1971, pp. 6-11). The Elam essay indicated that a teacher education program is competency-based if the competencies to be demonstrated by the student are derived from explicit conceptions of teacher roles, stated so as to make possible assessment of a student's behavior in relation to specific competencies, and made public in advance. The assessment of the student's competency uses his performance as a primary source of evidence although it takes into consideration evidence of the student's knowledge.

Competency-based teacher education proposes to analyze teaching into a set of operations or tasks in order to accomplish the needed reforms in

eliminating the gap between theory and practice. The prospective teacher would be trained to reach competence and certified in each of the tasks necessary to become a competent teacher. Having gone through a competency-based program, the prospective teacher would be ready to cope with whatever might be encountered in the schools of the real world.

PROBLEMS AND ISSUES OF COMPETENCY-BASED EDUCATION

Advocates of CBTE point out the fact that the movement is not without its problems, criticisms and critics. Schmieder (1973, p. 24) states:

> Any movement as complex as that for competency-based education is sure to inspire a great many relevant--and even some not so relevant--questions and issues regarding developmental problems and priorities.

The critical questions and issues regarding competency-based teacher education have been discussed by several authors (Brooks, 1974; Finch and Hamilton, 1974; Broudy, 1972).

Brooks (1974, p. 7) listed six of the frequent criticisms of competency-based education:

1. The "sum of the parts" does not always equal the whole, and thus, the mere fact that students are able to demonstrate competence in isolation does not guarantee success in the classroom.
2. Because the competency-based program has as one of its foundations a systematic approach, it is mechanistic and dehumanizing.
3. A competency-based program claims individualization, and yet each student is expected to display the same competencies; this claim does not seem consistent.

4. Trivial behaviors are those most easily operationalized; the really important aspects of teacher education may be overlooked.
5. We really know so little about how children learn that it seems ridiculous to base a program on competencies that may not be the appropriate ones.
6. The really important areas of teaching are in the affective domain, and these are very difficult to categorize and measure.

These concerns have been discussed and excellent rebuttal statements have been presented in the literature supporting the competency-based education movement. Each teacher education program will have to resolve these questions concerning the value and effectiveness of competency-based teacher education for their own institution.

COMPETENCY-BASED TEACHER EDUCATION'S CHALLENGE

Rosner and Kay (1974) state that the long-range promise which CBTE challenges teacher education to accomplish is to improve the quality of instruction in the schools. This long-range promise is certainly a justification for CBTE. It is based upon two very important assumptions: (1) that effective public schools are largely dependent on the quality of teaching, and (2) that competent teachers can be prepared by teacher education programs.

As implied in the assumptions, more knowledge concerning relationships between elements of teacher education curriculum and indicators of effective schooling needs to be acquired. CBTE offers the intermediate

promise that teacher education institutions will have the demonstrable capability of preparing knowledgeable and skillful teachers in curricula whose component parts have been tested for validity against criteria of school effectiveness. This implies that teacher education programs will be willing to subject the elements of their curricula to empirical test.

Professional recognition and commitment in CBTE is expected to result in more extensive support of teacher behavior research and the generation of interdependence between teacher behavior research and teacher education program development and implementation. Another challenge that CBTE offers is to stimulate widespread professional recognition of the hypothetical, tentative nature of various teacher education curriculum elements, and professional consensus on the need to validate these elements. CBTE should stimulate a commitment to tool up for the necessary development and research to strengthen teacher education programs.

A Challenge for the Faculty

The faculty who participate in competency-based instruction must have a strong commitment to the initial preparatory program for teachers and believe that it is a critical component of the total teacher education program. In implementing any new program time is needed and changes must be made which require adjustments on the part of the faculty. Giles and Foster (1975) indicate that efforts to solicit faculty participation have pointed out the importance of modifying faculty loads to account for the additional time and effort required in establishing the program. Recognition of the efforts and accomplishments of faculty members must be

made and positive reinforcement given for faculty participating in an assignment demanding increased time for instruction and student contact.

A Challenge for the Students

Students are challenged to focus their attention upon their performance. A recognition must be made of the fact that their success will be judged on performance as opposed to strictly cognitive experiences. Grading will more than likely be on a "pass-fail" basis rather than by the conventional grading system. An adjustment must be made to the grading system. Students are challenged to participate in many more activities than are required in the traditional pattern. Since the assignments usually require continuous participation in a school setting, students are challenged to acquire and exhibit professional behaviors earlier than the student in the traditional teacher education program.

Students are challenged to develop the capacity for self-evaluation. This skill is developed early and requires the additional competency of evaluating with objectivity. Students electing the competency-based, field-oriented patterns of teacher preparation must recognize that they will forego many of the campus activities that would be available in the traditional program. Students are challenged to fulfill time commitments in the field which often preclude their participation in many campus activities.

A Challenge for Accountability

CBTE establishes a framework from which teacher education programs can demonstrate accountability. Knowledges, skills, and behaviors deemed necessary for beginning teachers, and the evidence acceptable for assuring that students possess these competencies are explicit and made public in

advance. CBTE offers the immediate promise of increased prospects for accountability.

In competency-based teacher education the student is held accountable for performance. Not only are the competencies derived from explicit conceptions of teacher roles, they are also made public in advance so that students can work toward developing these competenices. The competencies are stated so as to make possible assessment of the student's behavior in relation to each. The criteria to be employed in assessing the competencies are based upon the competencies to be developed. The expected levels of mastery under specified conditions are also made public in advance.

Competency-based programs are systematically designed with continuous feedback which makes the program more accountable for funds spent within the program. The student's performance is used as the primary source of evidence that the student has developed competence as a teacher. Objectivity within the program is strived for in CBTE. Not only is the performance of the student assessed but also evidence of knowledge relevant to planning for, analyzing, interpreting, and evaluating the classroom.

Accountability is evidenced in competency-based teacher education by measuring the student's rate of progress by demonstrated competence rather than by time or course completion. The program utilizing CBTE will design the instructional program to facilitate the development and evaluation of the student's achievement of the competencies specified rather than unidentified fuzzy concepts.

This, then, is the challenge of competency-based teacher education. Let us hope that its course will continue to be charted wisely. The papers which follow serve to assist in this charting process. Each focuses on meeting the challenge which competency-based teacher education has provided for us.

COMPETENCY-BASED EDUCATION: STATUS AND RESEARCH

ESSENCE OF COMPETENCY-BASED EDUCATION

What is competency-based education (CBE)? This question has been asked and answered, discussed and debated all too often, typically with confusing results. Each person reflects his own value system as he puts on his unique set of blinders and defines this movement. It has been pointed out elsewhere (Houston and Howsam, 1972) that CBE is a coined term, a term found in no dictionary. One could take each word, define it, then relate it to the others. Such a process would derive a description of CBE something like: "An educational program based on competencies." Such a description, however, does not deal with the central issue—what is competence? The specific characteristics of competence are personal, both in their demonstration and in their evaluation.

Each of us has a conceptual model of the competent professional, whether a teacher, physician, engineer, architect, or administrator. Our model may be quite explicit or it may be vague; it may be synergistic and wholistic; or it may consider only a minor portion of the tasks performed. It may or may not realistically reflect professional behavior or reality; but it is our model, and it directs our actions and reactions vis-à-vis that professional role.

Think about the physician. What do doctors do? How do they act? How do patients act when in their offices? Their behavior, and the

patient's actions often are played out as a drama where the script is already written, only the precise lines of dialog need be completed. The individual's perception of the physician may be greatly in error. After all, few of them see the many facets of the physician's professional role; but what they see channels their conception of him.

Compare that role perception with that of a lawyer. Think of the client in an attorney's office. What role does he typically play? How does his role differ from expectations for the physician?

Consider other professional roles--social worker, accountant, teacher, engineer, school administrator. For each one, the individual has derived a model of expectation and a model of competence.

Competence, then, is a conceptual model of an effective professional which is based on experience. Each individual, whether in that role or not, has derived his own definition of competence. Usually he can characterize someone as competent or not, even though he has difficulty in articulating the criteria used in that judgment.

In most competency-based programs, the staff has somehow pooled these conceptions of competence and delineated a mutually acceptable list of competencies. These competencies are, in reality, indicators of competence.

Faculties have expended hundreds of hours deriving and refining these sets of competencies. Some have used only their own professional judgment; others have made extensive task analyses, formulated a theory, and deductively derived competencies from the theory. Others have relied on training programs from the past to define objectives for the future, and still others have sought to ground their set of competencies

in the social fabric of our times and in the roles society has assigned to the professional.

Whatever means and procedures are used in developing a set of competencies, that set is a poor reflection of the conceptual model of competence. First, it includes only some of the elements of competence. Not all factors are, can be, or perhaps should be noted as competencies. The competency list typically includes only the most obvious indicators of competence. Second, those competencies listed often are based on training needs. As competencies are conceptualized by program developers, a mental screen seems to eliminate or modify those less conducive to educating the professional. Third, the written specifications apparently are never so good as the conceptual model. Somehow, as the mental picture is described in words, something is lost in translation. Last, the original conception was not singular but usually from many persons. The basic model was really models. The sum of competencies in a program, then, is only an approximation of competence.

Why spend so much energy in specifying competencies? Human nature and some research to date have indicated that persons are more likely to achieve delineated goals and objectives than fuzzy ones. (Duchastel and Merrill, 1973; Meunier, 1974; Dawley and Dawley, 1974; Duchastel and Brown, 1974). Further, professional education programs are more likely to teach to relevant objectives if their best efforts have served to specify the most appropriate approximation of the model professional.

Competency lists are very similar. Perhaps this is due to an effective communication network among developers but not entirely.

Many groups have identified competencies which resulted in similar lists regardless of the data base used in formulating them.

In February 1975, the results of a survey of competencies most desired by teachers were reported to the Annual National Conference of the American Association of Colleges for Teacher Education 1975). During 1973-1974, 1512 teachers reacted to a set of thirty-three competency statements as part of a series of needs assessment studies. The competencies, derived from task analyses of teacher practice, included three general areas: (1) design and evaluate instruction, (2) interact with students, and (3) professional behavior. A test booklet included: (1) a listing of these competencies, (2) a detailed description of subcompetencies, and (3) a nine-point self-assessment scale for each competency, with descriptors of competence at three of the levels. Teachers reacted to each of the thirty-three self-assessment scales in two ways: perceived current level of competence and perceived desired level of competence.

The pattern of their responses to desired competencies was clear and consistent. Competencies which specified interaction with students were clearly perceived as more important than those involved with designing or evaluating instruction or in other non-student interaction roles. The eight most desired competencies are listed below.

The teacher:

1. Organizes resource and materials for effective instruction.
2. Gives clear, explicit directions to students.
3. Responds to "coping" behavior of students.
4. Identifies clues to student misconceptions or confusion.

5. Provides for the appropriate use of a variety of communication patterns within the classroom.

6. Utilizes a variety of instructional materials and resources.

7. Builds self-awareness and self-concepts in students.

8. Reacts with sensitivity to the needs and feelings of others.

Competencies in the highest quarter (those most desired) included all four of the communication competencies. Competencies dealing with accessibility and use of instructional resources were included as were two of three interpersonal competencies (facilitating student self-awareness and affective interaction with others).

Those competencies are compared with the ones included in the bottom quarter of desired competencies which are listed below.

The teacher:

1. Administers and interprets assessment techniques (i.e., standardized tests and sociometrics).

2. Designs and uses teacher-made diagnostic tests.

3. Gathers information on individual differences among students such as interests, values, cultural and socio-economic background.

4. Groups students on basis of data.

5. States competency-based objectives correctly.

6. Plans activities with students.

7. Evaluates teaching behavior using coded instruments and plans for change on basis of results.

8. Interacts and communicates effectively with parents and community.

9. Works effectively as a member of an educational team.

Four of these competencies were concerned with collecting data and a fifth defined how data were to be used. It is a paradox that, while many teacher

educators are concerned that teachers make decisions on the basis of data, teachers themselves rate this skill quite low.

Three other competencies teachers rated in the lowest quarter, all related to interaction, pose a second dilemma. Teachers rated planning with students, interacting with parents and community, and working as a member of an educational team among the least desired competencies. Although communication and interpersonal relations (primarily under the teacher's control) were highly rated, those involved with adults or on a less-controlled basis were rated considerably lower.

The pattern of teacher response seems to be more general than first believed. When the study was presented at AACTE, the audience was invited to discuss the findings. At that time several other studies were described. Their findings were amazingly consistent with the results of the Houston study.

The implications of these data for teacher preparation and inservice education are noteworthy. The focus of efforts should be on that phase of the job in which the professional directly interacts with his client. This does not preclude other concerns in the curriculum, but it does suggest a point of emphasis.

Research on teacher effectiveness or as Jere Brophy prefers to call it, optimal teaching, provides another perspective for identifying competencies. A national conference on research in teaching was held November 3-5, 1975 at the University of Texas at Austin. Most of the researchers in attendance were currently studying teacher effectiveness. For three days, they presented their findings from extensive observational studies, some conducted over a period of several years. Although they

couched their conclusions in the conservative and tentative language of researchers, some general impressions of those findings from a practitioner seeking the best evidence are available.

No single variable was consistently important as a measure of teacher effectiveness; the configuration of variables, the context, and the interrelationship of student-teacher interaction were more powerful. Differences were found in effective teacher behavior between primary and intermediate grades and between low and middle socioeconomic areas.

Clearly evident was the effect of direct instruction on student achievement. Rosenshine (1975) summarized studies by Stallings, Soar, and Brophy and Evertson on primary grade reading and mathematics achievement. He described direct instruction as an approach where:

> . . . the teacher is the dominant leader of the classroom activities, one who decides which activities will take place, and who directs without giving reasons. A good deal of time is spent on number and reading activities using textbooks and academic workbooks or in verbal interactions directly on reading and mathematics. Students are supervised by the teacher while they work, and there is little free time or independent-unsupervised activity. Students usually work in small or large groups. Teacher questions or workbook questions tend to be narrow and at the child's level so that pupils have a high percentage of correct answers. The questions usually have only a single answer, and the teacher immediately reinforces the answer as right or wrong. There is little discussion of the answers. Correct answers are followed by another question, incorrect answers are followed by the teacher giving the answer. The learning is approached in a direct and business like way and is organized around questions posed by the teacher or materials provided by the teacher.
>
> There are two ways to describe the opposite from direct instruction. In the Follow Through programs, which contained programs ranging from highly structured to highly inquiry oriented, the opposite to direct instruction were classrooms in which there was more game-like activities, and art work, and where play was an object in itself. The pupils had free choice, free work groups, and frequent socialization. The teacher approaches learning in an informal manner, organizes learning around a pupil's own

problem, encourages pupils to express themselves freely, asks open-ended questions on academic and non-academic topics, and joins in the pupils' activities.

Time involved in learning activities seems to be related to student learning. When classes were observed over long periods, the amount of time each student was actually engaged in instruction was amazingly short. Berliner cited cases where the teacher allowed 45 minutes for students to complete a task, but individual students worked as little as three and one-half minutes on it. McDonald reported in a California study that individual students were engaged in actual reading instruction only 40 hours a year, even though reading was identified as one of the most important subjects. Teachers should consider their own practices in terms of the actual time each student actually is engaged in meaningful learning activities. They should consider the class as a whole, and from the perspective of individuals in the class. Further, teachers may need to reconceptualize organization and management to accomodate greater teaching time. For students from lower socioeconomic homes, time becomes even more critical. Their absence rate is higher while the amount of study time out of school is lower, reducing still further the time spent on learning.

Researchers concluded that structure seemed to facilitate learning while chaos was disfunctional. They found praise to be moderately but not strongly related to student achievement. The pattern of praise was important with those who praised often, being less effective than those who reserved it for special cases. Corrective feedback to students by the teacher was an important correlate of teaching effectiveness, but it rarely occurred.

Simply having a wide variety of materials available to students was not related to effectiveness; neither was multiple instructional options. The appropriateness rather than number of instructional resources was important. When students were engaged in independent activities, the availability of the teacher to assist students elicited positive results.

Class discussions are not so prevalent as often thought. In the primary grades, higher order questions were disfunctional, but lower order questions were positively related to learning. Pupil-pupil interaction rarely occurred.

Although teacher perception and research findings may not produce conclusive results and cannot be rigidly employed in program design, they provide some directions for practitioners. Summaries of research such as those by Rosenshine and Furst (1971) and interpretations by Good and Brophy (1973) and by Dunkin and Biddle (1974) provide a wealth of clues for improved teacher education.

EXTENSIVENESS OF CBE IMPLEMENTATION[1]

Conference programs and professional chatter would indicate that many institutions are engaged in competency-based programs. Critics might add that they were lured there by federal dollars, power-hungry state education departments, and fast-talking colleagues. The actual extent to which CBE is being implemented probably cannot be known, but CBE is extensive and growing.

---

[1]The author is indebted to Karl Massanari for his assistance with data in this section.

Several years ago, the AACTE (1973) conducted a survey of 1250 institutions preparing teachers, asking if they were operating, investigating and/or planning CBTE programs. Of the 783 respondents (a 63 percent return), 131 (17 percent) said they were operating CBTE programs, 228 (29 percent) said they were not, and a large number, 424 (54 percent), said they were in some stage of investigation.

In May 1973, Educational Testing Service in conjunction with AACTE (Sherwin, 1974) conducted a follow-up survey of the 131 institutions that had identified themselves as having competency-based programs in the initial survey. Seventy-five usable responses were received. A large proportion of the respondents, 71 percent (53 institutions), had operated CBTE programs less than two years. Most of the CBE activity occurred at the undergraduate level. According to the returns, a total of 24,399 students were engaged in CBE programs.

State education departments have assumed more proactive stances in the development of certification plans. Some confusion has resulted in the literature between Competency-Based Education and Competency-Based Certification. Resolutions in professional association meetings and writings and speeches by educators attacking CBE often are supported by data on certification/credentialling requirements. This has been true particularly in New York where a CBE mandate is being implemented.

During the past five years, every state has studied CBE/Competency Based Certification (Pittman, 1975). Twenty-six states have revised their teacher education and certification standards, resulting in approved Program Approaches. Of the 29 states who now utilize the approved Program Approach, 17 either have developed separate CBTE standards or the

approved Program Approach, which permits the state to encourage CBE. Twenty-three states have produced documents which specifically address either CBE or CBC.

Thirteen states have formed a national consortium to share information, materials, and training procedures, and to help member states to develop management systems for competency approaches to teacher education and certification. The Multi-State Consortium is composed of Arizona, California, Florida, Michigan, Minnesota, New Jersey, New York, Oregon, Pennsylvania, Texas, Utah, Vermont, and Washington.

Professional organizations and learned societies have reacted to the CBE movement in a variety of ways. The National Education Association condemned it as being premature in a 1974 resolution passed by NEA General Assembly.[2] The American Federation of Teachers has supported CBE while vocally condemning certification based on such processes. Social science and humanities associations typically have been opposed to the movement while more technically oriented associations have supported it or remained silent on the issue. Table 1 summarizes a study of professional organizations made by Massanari (1974). Of 91 associations polled, 67, or 74 percent, responded to the survey.

The Research and Development Center for Vocational Education at Ohio State University has specified a set of competencies and pilot tested over 100 supporting instructional modules. A national CBE center in the liberal arts has been established at Bowling Green University. The School Library Manpower Project administers six experimental CBE program models.

---

[2]The motion was made and seconded by two New York representatives with much of the discussion confusing mandated certification with educational process.

Dentistry, nursing, medicine, allied health, business administration, law, social work, engineering, and nuclear radiology are but some of the fields outside teacher education in which CBE is being employed. Several liberal arts colleges are experimenting with a CBE approach.

Table 1

CBE Activities by Professional Associations

Activity	No.	Percent
Actively Involved in Some Way	40	60
Session(s) on CBTE at Regional or National Conference	33	49
Committee Studying CBTE	32	48
Published or Planning to Publish Article(s) on CBTE	33	49
Developed or Are Developing:		
List of Competencies	20	30
Position Statement	17	25
Engaged in Experimental Work in CBTE	7	10

At the federal level, Teacher Corps, Fund for the Improvement of Post Secondary Education, and Career Education are among programs highlighting CBE approaches. The Free University of Iran opens in 1977 as a completely competency-based institution. Teachers colleges in Israel, Saudi Arabia, and England are studying CBE. UNESCO sponsored a week-long training conference in 1973 for its chief technical advisors from around the world. An innovative project in technical education operates in Munich and one on basic education functions in Brazil.

The mass of published materials about CBE has grown in the past three years. Many of these materials are redundant, but a growing realization can be perceived of the power of the movement, the need for less rigid systems, the evolving creativity of approaches, and the growing number of persons who have just discovered CBE.

JUST A FAD?

In the summer of 1975, an Iranian educator asked if CBE was just another American fad. He recalled "teacher proof" curriculum materials, computer-based instruction, interfacing, and other terms and movements that seemed to perish just as they became known. His conclusion was that Americans thrive on the new and different and that they cannot stabilize long enough to test the worth of a movement or idea.

Perhaps CBE is just another fad. However, its roots are deeply embedded in basic American traits. The focus on objectives, on pragmatic results, on refinement based on feedback is part and parcel of the free enterprise process. The name may change, but the basic tenets of the movement will remain as residuals in most future educational endeavors. With rapidly developing technology and a changing society, the basic philosophy and concepts of CBE remain the most viable approach. Because of its regenerative process, CBE should lead to even more effective preparation processes and movements.

Professionals continually feel they are pressed to produce results. The doctor must cure his patient; the lawyer free his client; the teacher facilitate student learning. Dr. Ann Olmsted, sociologist on the medical faculty at Michigan State University, pointed out in a recent meeting of

a Phi Delta Kappa National Commission that general practitioners in medicine could be characterized as simply keeping the patient alive until his natural body functions made him well. The parallel with teaching is all to evident. Some teachers may be contributing to student learning by keeping them in a school while their natural curiosity and instincts stimulate learning. Research studies reported earlier tend to support this. More effective teachers are those who teach and teach directly, structure their instruction, and engage students actively over longer time periods in learning activities. They know what their goals are, and they teach to those goals.

Research on teacher effectiveness at the elementary school and high school levels may be equally applicable in universities. Direct instruction, time on tasks, corrective feedback by teacher, and structured learning may be important ingredients in the process.

The emphasis of competency-based education on objectives which are reality oriented and based on practitioner needs, which include instruction tailored to objective achievement, which employ evaluation that compares achievement with objectives, and which use corrective feedback to improve practice may provide the process for improved professional practice.

Charles Kuralt, in one of his television series "On the Road," summed up an American philosophy and spirit with these lines:

> As our country reaches for its 200th year, we realize
> It is not how old are you
> But what have you done, and
> What can you do.

These comments also reflect the spirit of the competency-based education

movement. The essence of competence is doing, not simply knowing how or what to do. The ultimate criterion of such actions is in accomplishments, in results, in the consequences of actions. The prospects for improved education the years ahead are indeed bright.

INSTRUCTIONAL MATERIALS FOR PERFORMANCE-BASED TEACHER EDUCATION

INTRODUCTION

Seldom in the history of teacher education has an idea received such widespread interest and rapid acceptance as has performance-based teacher education (PBTE). Developmental work is proceeding in a number of research and development centers, traditional teacher education programs are being modified to meet some or all of the criteria of PBTE, and the installation of completely new PBTE programs is being contemplated in a great many teacher education institutions.

In spite of this, there is much that is still unknown about how best to design curricula and how to organize and manage PBTE programs. It is the purpose of this paper to bring together some salient information about the current status of PBTE as it relates to vocational education and to describe a rational approach to PBTE program development. Particular attention is given to the urgent problems involved in constructing and refining individualized instructional materials that incorporate the principles of PBTE. The work of the Performance-Based Curricula Program at The Center for Vocational Education has provided a basis of knowledge and experience for much of what follows.

Material has been drawn from the following relevant documents prepared by Center staff:

James B. Hamilton and May W. Huang, Resource Person Guide to Using Performance-Based Teacher Education Materials.

Robert E. Norton, Lois Harrington, and Janet Gill, Performance-Based Teacher Education: The State of the Art.

Glen E. Fardig, Robert E. Norton, and James B. Hamilton, Guide to the Implementation of Performance-Based Teacher Education.

These documents, at present in draft form, are covered by developmental copyright and therefore may not be reproduced. However, these and other materials will be available to the education profession in final published form in the near future.

PBTE DEFINED

PBTE is an approach to teacher preparation in which the teacher is required to demonstrate essential teaching tasks in an actual teaching situation. Actual performance of the tasks insures that the teacher has not only the knowledge required but also the ability to perform competencies (knowledge and teaching skills) that are essential to successful teaching. Many traditional teacher education courses have tended to place emphasis on the theory of teaching rather than focusing upon the specific teaching skills needed. In PBTE programs, individuals must demonstrate their ability to perform as teachers in an actual classroom. Traditional teacher education programs and state certification regulations have focused on giving teachers the necessary number of courses with the proper course titles in order to meet graduation and certification requirements. In PBTE programs, the focus is upon demonstrating specified competencies essential to successful teaching.

The terms "Competency-Based Teacher Education" (CBTE) and "Performance-Based Teacher Education" (PBTE) are often used synonymously by educational leaders. Some educators, however, distinguish between the two terms. The use of the word "competency" emphasizes the fact that

learning in competency-based programs is structured around the identified and verified competencies needed by teachers. The term "Competency-Based Teacher Education" is, therefore, appropriate for any such teacher education program structured upon identified teacher competencies. In performance-based programs, the work "performance" is used to emphasize the fact that these programs require teachers to demonstrate their ability to perform the essential competencies in an actual classroom setting. The Center's Professional Vocational Teacher Education Curricular materials are structured upon identified and verified teacher competencies which the learner is required to perform in an actual teaching situation. Regardless of the terminology preferred by individual practitioners, the preparation of the individual to perform effectively in the teaching role remains of utmost importance.

CHARACTERISTICS OF PBTE PROGRAMS

The study of widely accepted concepts of PBTE and of many individual PBTE programs has resulted in the identification of several characteristics of teacher education programs which are considered essential if the program is to be considered a PBTE program. These essential characteristics are:[1]

1. Competencies to be demonstrated by the student are identified, based upon what a teacher must know and be able to do. The competencies are stated as behaviors which

---

[1]Adapted from American Association of Colleges of Teacher Education, Achieving the Potential of PBTE: Recommendations, PBTE Series: No. 16 (Washington, D. C.: American Association of Colleges for Teacher Education, 1974), pp. 32-33.

can be assessed and are shared with the student at the beginning of the program.

2. Criteria to be used in assessing each specific competency are stated, including the conditions under which assessment will occur and the expected level of mastery. Criteria are also shared with the student at the start of the program.
3. The instructional program focuses upon development and evaluation of the specified competencies by the student.
4. Assessment of the student's competency uses his/her performance in the teaching role as the primary source of evidence. Objective evidence of the student's knowledge related to planning, analyzing, interpreting, or evaluating situations or behavior are also considered.
5. The student's rate of progress through the program is determined by demonstrated competency rather than by time or course completion.

In addition to the above essential characteristics there are several additional desirable characteristics of PBTE programs. These include:

1. Instruction is individualized and personalized.
2. The learning experience is guided by feedback.
3. The program as a whole is systematic.
4. Emphasis is on exit, not on entrance requirements.
5. Instruction is modularized.
6. The student is held accountable for performance.

Although many of these have long been associated with sound instructional practice, they are particularly relevant to PBTE programs.

PBTE AND TRADITIONAL PROGRAMS CONTRASTED

It is evident that a great deal of emphasis is placed upon the identification, attainment, and assessment of teaching competencies. It may be helpful in describing PBTE programs to contrast several features of PBTE programs with features often used to characterize traditional teacher education programs. In Figure 1, characteristics of seven aspects of conventional vocational teacher education programs are contrasted with the same aspects for PBTE programs. These contrasts are presented as general contrasts between the two types of programs. However, it should be noted that in examining individual conventional teacher education programs, one or more of the program features characterizing PBTE programs might be found.

CURRENT STATUS OF PBTE: VOCATIONAL TEACHER EDUCATION[2]

As one would expect, the growth of PBTE for vocational teachers has tended to parallel that of general education. However, there are several distinct differences. The U.S.O.E. funded Elementary Models Projects, which served as a catalyst for PBTE at the elementary teacher level, were perceived as having little direct relevance for vocational and technical teacher education. Thus, vocational teacher educators were somewhat slower than other groups with regard to setting up PBTE programs. In fact, much of the current effort in PBTE is, at least in part, based upon research completed at the Ohio State Center (Cotrell and others,

1972). This data base seems to have served as a starting point for a number of PBTE programs designed to meet the needs of vocational teachers. For example, Michigan, Texas, Oregon, Illinois, and Mississippi utilized the competencies identified by Cotrell and others (1972c) as a basis for their own curriculum research and development efforts. In many cases, competencies were verified at state and regional levels and then programs devised which built upon these competencies.

Current indications are that a number of vocational teacher education institutions are designing and implementing PBTE programs. In fact, several vocational teacher education departments are leading the way in this regard (e.g., Temple University, University of Nebraska, Wayne State University, University of Minnesota).

Response to a recent request by the Ohio State Center for state directors to nominate institutions to participate in The Center's advanced testing of performance-based vocational teacher education curricula resulted in responses from 37 states and nominations of some 70 institutions. Letters requesting inclusion in the testing were received from 40 of these institutions. Other indicators of the PBTE movement's strength in vocational teacher education are the results from a recent market survey which the Ohio State Center conducted relative to projected demand for use of its performance-based curricular materials. Over three-fourths of the 237 respondents indicated that they had competency-based teacher education programs in operation or in the planning stage.

For the benefit of those who are considering PBTE program implementation, it may be meaningful to provide brief descriptions of a few

successful programs. These are representative of the work that is currently going on across the country.

At the University of Minnesota, the preservice "Teaching Methods in Agriculture" is competency-based, individualized and modularized. This program consists of 29 modules, 23 of which must be satisfactorily completed prior to student teaching. One learning laboratory is provided for group discussions and simulated teaching with peers, while another is equipped with carrels for individual study, listening and viewing. Facilities are also provided for small group discussions, and viewing and critiquing of student videotapes as well as tapes of master teachers. Student performance is assessed under simulated teaching conditions prior to student teaching and also during student teaching experiences.

University of Nebraska's "Preparation by Prescription for VO-AG Teachers" focuses on the development of 74 teaching behaviors needed by first-year teachers of vocational agriculture. To provide students with the ability to perform these behaviors, 30 challenges (learning tasks with assignment sheets and audiotape discussions) were developed. During the first five weeks of the "professional semester" students work on demonstration, writing, explanation and performance tasks on an individualized basis. Each student views "Master Teacher" videotape situations and participates in at least 10-12 critiqued micro-teaching sessions prior to the six weeks of student teaching. Following student teaching, an intensive five-week class-laboratory-workshop Program Planning Course allows each student to proceed at his/her own pace through 16 challenges (53 objectives) involving audiotape programmed instruction. A learning laboratory provides students with opportunities to listen and complete

assignments and provides teacher educators with an opportunity for individual and small group instruction. Each assignment is graded, and unsatisfactory performances are redone until judged satisfactory.

A number of other PBTE activities may be mentioned to illustrate the wide-ranging and pervasive nature of the ongoing effort.

1. Faculty at Wayne State University have established an across-the-board PBTE program in a typical four-year vocational teacher education context. The Wayne State program is most comprehensive and has now been operational for several years (Cook and Richey, 1975).
2. At Temple University, a PBTE program has been implemented to meet the in-service needs of trade and industrial teachers. Perhaps the most notable aspect of Temple's program is that it is entirely field-based. That is, teachers may develop competencies in the schools rather than on the campus of the University (Adamsky and Cotrell, 1975).
3. University of Michigan's PBTE program is designed primarily for aspiring occupational teachers who transfer from community colleges. The use of competencies enables students to complete baccalaureate degree requirements in a minimum amount of time (Vogler, 1975).
4. Seventeen states have mandated the approach as a full new or alternative system for teacher education and certification; 15 others are considering similar action. Several states plan full implementation within the next several years.

5. Approximately 500 institutions of higher education have pilot programs, about 120 have large operating programs, and 15 have institution-wide programs.
6. Thirty-one states have joined the Interstate Certification Project concerned with the mobility of educational personnel and interstate reciprocity of teaching certificates. A major focus of the 74-75 program is on transferability problems relating to competency-based education.
7. Fourteen states have formed a national consortium for the purpose of sharing information, materials, and personnel and for helping member states to develop management systems for the development and use of performance-based approaches to teacher education and certification.
8. There is a National Clearinghouse on PBTE at the American Association of Colleges for Teacher Education in Washington, D. C.
9. An Institute for Research and Development of Competency-Based Teacher Education Programs has been formed in the College of Education at Wayne State University.

Due possibly to the speed with which the PBTE movement has swept the nation, the pressure of mandates, or a zeal to improve teacher education programs, many programs and projects presently under development or in operation have incorporated varying pieces of the form of PBTE, frequently without capturing the real substance of PBTE. There are a wide range of activities being conducted under the banner of PBTE: modules without programs; programs without (or with loosely defined) competencies;

competencies without programs; programs which equate field-based with competency-based; programs with competencies but without performance; programs with performance but without competencies, etc. The following section describes some of the varied research and development efforts going on relative to the identification and validation of competencies, the development of curricular materials, the development and implementation of programs, and the development of assessment procedures and instrumentation.

COMPETENCY IDENTIFICATION AND VALIDATION

Patricia Kay (1975) identified three basic procedures for deciding what competencies should be included in a PBTE program. From least to most operational they are: (1) theoretical approaches, (2) task-analytical approaches, and (3) course conversion approaches. Kay says that probably no program has used only one approach that most likely contains elements derived from all three. She further delineates the task-analytic approaches into the following five sub-categories: (1) basic task-analytic procedures, (2) analysis of the teaching performance associated with curriculum packages, (3) school learner needs assessment, (4) analysis of projected teaching roles, and (5) empirical hypothesis generating.

The task or role analysis procedure with its many variations is probably the most commonly used by vocational educators. This approach typically involves identifying the competencies involved in teaching in a given area or at a given level by: (1) conducting a search of the literature; (2) asking teachers working in that area and/or at a given level to describe what they do, what they feel they should be doing; and

what additional skills they feel they need; and (3) asking teacher educators, supervisors, and administrators to describe and verify what teachers do and/or should be doing. Criticism of this approach stems from the fact that this procedure may perpetuate the status quo, since it tends to emphasize competencies which represent what teachers do, and not necessarily what teachers do or should do that, in fact, promotes student learning.

One type of task-analytic approach, the school learner needs assessment approach, appears most desirable and is yet perhaps the most difficult and least useful at this time. While the goal among teacher educators has long been to train teachers in the skills which will result in maximizing student achievement, to date there has been no research which conclusively links particular teacher behaviors to specific student achievement. Nonetheless, efforts to identify competencies using this procedure have been attempted. For example, in Minnesota, The Task Force to Study Programs Leading to Certification for Teachers of Social Studies (1973) started with the identification of "pupil outcomes toward which a competent teacher makes progress." From there, they generated a list of "teacher behaviors which facilitates achievement of pupil outcomes." Finally, they developed a list of "competencies which facilitate those teacher behaviors."

The course conversion procedure is also very frequently employed, particularly in states where a mandate has been issued. This approach commonly results in the translation or reformulation of present courses into new statements of behavioral objectives or competencies. The knowledge and skills a teacher should possess are inferred from the current

course content. As with the task-analytic procedure, this approach tends to perpetuate the status quo and hence is not likely to result in many significant program changes. An advantage of this approach, however, is that it is expedient—changes can be made quickly and at relatively low cost.

The theoretical approach, while conceptually very promising, is undoubtedly the most costly and difficult to utilize. This approach requires extensive study and research and a high degree of both technical skill and conceptual expertise among program developers. Theories and models of learning and human behavior are complex and abstract and require a great deal of interpretation and extrapolation. There is also the limitation that theoretically derived programs can only be successful if the underlying theories used are, in fact, accurate descriptions of the realities of the teaching process.

In specifying competencies by any one of these three procedures, there has been an attempt made in most cases to identify teaching competencies in each of the three learning domains: cognitive, psychomotor, and affective. Although critics have repeatedly accused PBTE programs of being dehumanizing and mechanistic, in many programs special efforts have been made to include the affective element. One of the categories specified by Benson, et.al. (1972) is "Nurture Humaneness." Florida International University's list of competencies includes "provide positive teacher-student interaction." Weber State's competencies include "interaction skills." The University of Texas at Austin composed each competency using a synthesis of three parts: problem solving, human relations, and job task. Likewise, the affective element is evident

throughout the Cotrell elements and criteria and the University of Nebraska's NUSTEP program.

One variable involved in competency generation is the level of specificity of the competency statements. To illustrate, the following list contains examples of various persons or institutions that have identified teacher competencies and the number of competencies they identified:

Michigan State Model Elementary Program	2,700 competencies
Cotrell	384 performance elements
Wright	327 teaching tasks
Courtney	130 items
Walsh	197 competencies
Burke	80 competencies
University of Texas at Austin	27 critical competencies
Florida International University	7 generic competencies
Lehigh University	4 competencies
Hite	2 competencies

Compare the scope of one of Cotrell's 384 competencies, "Write a Lesson Plan," with the scope of Hite's two competencies: Teachers can state objectives, and Candidate's pupils demonstrate growth consistent with stated objectives.

How many original competencies are identified and what level of specificity is used is not critical, however. What is critical is that each competency is ultimately broken down to a level of specificity which is measurable. Each of Cotrell's 384 elements is further broken down

into measurable criteria. For example, the element, "Write a Lesson Plan," is broken down into eight criteria, one of which is "The lesson was based on the specific student performance objectives." Similarly, at the University of Texas at Austin, the 27 critical competencies are broken down into 143 major competencies which, in turn, are broken down to 246 specific competencies. Therefore, while competencies may vary in scope and breadth, the ultimate product of the competency identification process must be measurable criteria if the program which is developed around these competencies is to be, in fact, performance-based.

Another variable is the level of mastery for which the competencies were identified. The Cotrell study attempted to identify all the competencies important to the successful vocational teacher. On the other hand, the State University College of New York at Buffalo and the Frieder model (Okey, Brown and Levie, n.d.) sought to identify competencies for the beginning teacher only. Many institutions have started with existing competency lists and selected from those lists the competencies which specify the level of mastery for which they are training teachers at their particular institution, state, or instructional area.

The validation procedures used by program developers to authenticate the competencies which were identified are, for the most part, similar to the procedures used to identify them. Although the term "validation" is used, it is more nearly a "verification" process. Lists of competencies were (1) compared to other lists; (2) given to educators at all levels and rated as to the importance of each item; (3) subjected to Q-Sort and Delphi techniques; and (4) compared to the literature.

Using these identification and validation procedures, or some combination thereof, a large number of competencies have been generated. There are lists of competencies generic to all teachers and lists of competencies needed by teachers of specific areas: Industrial Arts, Agriculture, Distributive Education, English, Elementary, Social Studies. What is needed now, according to Warmbrod (1974), is not identification of more competencies, but an effort to make sense and order out of the ones we have; that is, determine which ones do make a difference. Research is underway at a number of institutions for the purpose of relating teaching behaviors to student learning. The National Institute of Education (NIE) is supporting projects in this area by the Far West Lab, the California Commission for Teacher Preparation and Licensing, and the Research and Development Center for Teacher Education in Austin. According to Rosenshine (1974), large scale studies about the relationship between teaching competencies and student achievement are also underway at the Center for Educational Policy Research at Harvard, the Institute for Development of Human Research at the University of Florida, the Stanford Research Institute, the Bureau of Educationally Handicapped, and at the Purdue Educational Research Center.

MODULE DEVELOPMENT

For most of the PBTE programs currently in existence, specified competencies have been formed into some type of printed package. Most packages are called modules, some are called ILPs (Individualized Learning Packages), and some LAPs (Learning Activity Packages). While modules are not an essential characteristic of PBTE, their flexibility and adapt-

ability facilitate performance-based instruction. Some PBTE materials have been given special institutional or other type names (e.g., POP KITS, WILKITS, WAYNE KITS, MINN MODS). These packages vary in length from one-page outlines to totally self-contained booklets which include all necessary information and directions for use. The outline-type modules serve primarily to make public the competencies; many are similar to course prospectuses. Since two of the most desirable characteristics of PBTE are that instruction should be self-paced and individualized, the most fully developed, self-explanatory modules seem preferable. The majority of modules developed thus far do not include options for performance of the skill in an actual teaching role; the final experience or post-assessment tends to be of the paper-pencil variety or the student's performance in a simulated situation is assessed using a performance checklist or the resource person's subjective judgment. The modules produced by The Center for Vocational Education are unusual in that <u>each</u> module includes (1) a final learning experience which always involves student performance in an actual school situation, and (2) use of a "Teacher Performance Assessment Form" which lists detailed criteria for successful performance. If there is a single point at which existing programs break down in their quest to become truly competency- or performance-based, it is probably in the area of final assessment. If student competency is measured by a paper and pencil test, or if competencies are specified only to serve as a structure for course development and not as a basis for assessment, then PBTE is little different than the traditional course-approach to teacher education.

Existing modules generally have fairly similar elements as follows:

1. A listing of prerequisites
2. Directions for using the module; often this is handled using a flow chart
3. Rationale or introduction explaining the importance of the competency being covered
4. A listing of performance objectives: terminal and enabling
5. A listing of terminology, resources and materials needed
6. Preassessment--usually a short-answer test
7. Explanation of the activities to be completed in order to reach each objective; this is often in chart form
8. Information sheets
9. Feedback devices--most often essay or objective tests
10. Post Assessment--usually a short-answer test, but in some cases performance at the planning or simulation levels is involved, and occasionally performance in an actual school situation

The activities involved in most available modules are structured to offer the learner a number of alternate routes for reaching an objective. In addition, optional, enrichment, or quest activities are frequently included for the learner who desires to pursue a particular subject further. Activities typically involve reading, role-playing, planning, reacting to case studies, video-taping performance for critiquing by peers, and discussion. A number of modules also include recycling activities so that a student who does not achieve a particular objective initially can get further information or practice without repeating the exact same activities.

Module development models are proliferating. Most of these models conscientiously practice what they preach. For example, Heath at Oregon State University and Houston, et.al. (1972) have developed modules on writing modules; Kapfer and Ovard (1971) have developed an Instructional Learning Package on preparing and using ILPs; and Hyder (1971) has developed a Learning Activity Package on constructing LAPs. Drumheller (1971), Frantz (1974), Hauenstein (1973), and Silvius and Bohn (1975) have contributed to the area by producing documents explaining systems approaches to curriculum development. Arends, Masla, and Weber (1973) have produced the second edition of their CBTE module development handbook. Others, such as Fardig (1975), have produced handbooks or guides for the development of modules for secondary and post-secondary technical subject matter instruction. Additionally, many modules which have been developed by teacher education institutions as part of their PBTE programs are available and can serve as models.

DEVELOPMENT OF THE CENTER'S PBTE CURRICULUM

The Center for Vocational Education, The Ohio State University, has developed a Performance-Based Vocational Teacher Education Curriculum especially designed for use in implementing pre-service and/or in-service PBTE programs in vocational education. These PBTE curricular materials consist of 100 Professional Vocational Teacher Education Modules, a Student Guide, and a Resource Person Guide. The development of this curriculum involved three major phases: (1) the research base, (2) development of curricular materials, and (3) testing and revision of materials.

These three developmental phases, to be followed by a dissemination phase, are shown in diagram form in Figure 2.

THE RESEARCH BASE

Center work began with two research projects to determine the essential teacher competencies of vocational teachers. Approximately 1,000 vocational teachers, supervisors, and teacher educators were involved in the identification and verification of 384 performance elements, or competencies, considered essential for vocational teachers.

In the first phase of the study, essential competencies needed by teachers of conventional programs were identified. These were the teaching competencies needed by secondary and/or post-secondary teachers in agricultural, business and office, distributive, health occupations, home economics, technical, and trade and industrial education. This study resulted in the identification of 256 common competencies (competencies needed by teachers in two or more of the seven service areas studied).

The second phase of the research study sought to determine the essential teacher competencies needed by teacher coordinators in cooperative programs, namely off-farm agricultural, wage-earning home economics, office occupations, special needs, and trade and industrial education. A total of 385 teacher competencies were identified including those identified in Phase I of the study. These competencies were clustered into ten categories representing ten areas of vocational teacher responsibility. The findings of Phases I and II were then merged into one comprehensive list of 390 competencies and later reduced to a total of 384

Figure 2. Phases of the PBVTE Curricula Development

through elimination of duplication. These vocational teacher competencies are organized into the following categories:

A — Program Planning, Development, and Evaluation

B — Instructional Planning

C — Instructional Execution

D — Instructional Evaluation

E — Instructional Management

F — Guidance

G — School-Community Relations

H — Student Vocational Organizations

I — Professional Role and Development

J — Coordination

Finally, a set of performance-oriented general objectives specifying the task and the general criteria for evaluating a teacher's performance of the stated activity was developed.[3]

DEVELOPMENT OF CURRICULAR MATERIALS

Following the identification of the 384 vocational teacher competencies, work was initiated to develop the necessary curricular materials for implementing PBTE programs at the preservice and in-service levels for all vocational service areas. The curricular materials are in the form of individualized learning packages, or modules, each of which has as its base one or more or the 384 competencies. By basing the modules on the verified competencies, there is solid assurance that the objectives

---

[3]Calvin Cotrell, et.al., Model Curricula for Vocational and Technical Teacher Education: Report No. V—General Objectives, Set II (Columbus, Ohio: The Center for Vocational Education, The Ohio State University, 1972).

of the modules actually represent competencies needed by vocational teachers.

To further assure that the materials developed reflect the actual needs of vocational teachers and that the materials would be acceptable by all vocational areas, the module development process was structured to ensure maximum involvement of persons actively engaged in vocational teacher preparation. Each module was originally developed in cooperation with vocational teacher education faculties at Oregon State University in Corvallis, and University of Missouri in Columbia. Center staff worked with the writing teams at the institution sites.

An organized procedure of development, review, and revision was followed by the writing teams at each of these sites during the initial module development. Following the development of each module to the satisfaction of the faculty at the site, the module was then forwarded to the other site to be reviewed and critiqued by their faculty. Each module also was reviewed and critiqued by Center staff. Finally, a synthesis of all faculty and staff reviews was developed, and the module was revised by Center staff. From this process, 118 Professional Vocational Teacher Education Modules were developed and revised in preparation for initial testing.

TESTING AND REVISION OF THE MATERIALS

Initial testing of the performance-based curricular materials was carried out at Oregon State University, University of Missouri-Columbia, and Temple University. Each of the 118 modules was used by a minimum of 10 pre-service and/or in-service vocational teachers at one or more of

the test sites. Reaction forms were completed by each student for each module used and by each faculty member or resource person for each module they administered. In addition, in-depth taped interviews were conducted to clarify and gain additional feedback from students and resource persons for a sampling of the modules tested.

Concurrently, the California Testing Bureau of McGraw-Hill conducted psychometric refinement of the objectives and assessment instruments in each of the 118 modules. Several individual modules and entire categories of modules were also reviewed and critiqued by independent consultants and subject matter experts during this phase of the study.

Using the inputs from students and resource persons, the psychometric refinements, and the consultant reviews, each of the modules underwent major revision of content and format. A rigorous revision process was employed utilizing module revision teams of three persons each and standardized procedures to assure consideration of all inputs and to maintain standards of quality and uniformity in the materials. Several recombinations of performance elements were suggested by module users during the preliminary testing phase. Incorporation of these suggestions resulted in a reduction from a total of 118 modules to 100 modules.

Advanced testing of the materials is being conducted at 17 sites in diverse geographic areas and settings as well as several differing PBTE program structures. Feedback from each individual and each resource person using the modules is being gathered to further improve the materials. User feedback will also provide information as to the characteristics of the user and how well the materials serve his/her

needs. Following completion of the advanced testing and refinement of the materials, the Center's PBTE curriculum will be released for publication and dissemination.

A concerted effort has been made in the development of the modules to keep them consistent with the essential principles and concepts of performance-based teacher education. At the same time, the instructional materials have been made as attractive and convenient to the learner as possible. The following are some of the major features included in the module design:

1. Each module focuses on one or more verified vocational teacher competencies.
2. Modular design provides maximum flexibility for designing individualized programs.
3. Learning experiences allow for individual or group instruction.
4. All modules are suitable for preservice and/or in-service education.
5. Most modules are self-contained.
6. Optional resources include printed and multi-media materials.
7. The design permits use of local situation-specific materials.
8. Each module culminates with student assessment of the competency in an actual school situation.

The Center's instructional modules encompass the learning of a single identified objective or a small group of related objectives that can be learned effectively together. All of the learning activities presented in each module are directed toward achievement of the stated

objective(s). Basically linear in instructional design, there is, however, provision for individualized learning activity options and for the by-passing of learning activities by trainees who have acquired the designated competence through previous experience.

The instructional module consists of a number of components, each supporting and contributing to the strength of the whole. While the individual module is intended to be used as an instructional entity, the resource person may enrich the learning experiences and modify the instructional mode to meet the needs of individual learners. Although module structure varies somewhat depending on the subject matter content, the typical instructional sequence is given below. A graphic representation of the sequence is present in Figure 3.

1. A statement of the terminal instructional objective is provided for the student.
2. Cognitive knowledge necessary for the performance of the competence and its application is provided.
3. Opportunity for planning experiences is provided.
4. Opportunity for practice performance or simulated performance is provided.
5. Optional activities are suggested (for enrichment and for trainees with special interests).
6. Alternate activities are given for activities that may be difficult to complete (e.g., activities calling for the use of peers).
7. The trainee may select learning experiences depending on previous experience or personal need.

Figure 3. Typical Instructional Sequence for CVE Modules

8. Feedback and reinforcement are provided the trainee at the end of each learning experience.
9. Final demonstration of the specified competence takes place in an actual school situation.
10. The already competent trainee may "test out" of the module by going directly to the final experience.

PBTE AS AN INSTRUCTIONAL SYSTEM

Performance-based teacher education is conceived by Center staff as a system for the development and delivery of the instructional program—from identification of teacher competencies to teacher professional effectiveness. In this systematic approach, each component supports the others and each, in turn, is affected by the requirements of others. All of the components are directed toward providing an instructional gestalt in which the resource person and teacher trainee can work together cooperatively in the process of learning. Following is a brief description of the necessary components in this process, with a graphic representation given in Figure 4.

1. The system should be built on a group of verified competencies (e.g., Cotrell's list of 384 competencies needed by vocational teachers).
2. Overall structure and specific format of instructional materials must be developed.
3. Instructional modules should form the instructional core of the system.

Figure 4. CVE Performance-Based Vocational Teacher Education Delivery System

4. A student guide is needed to orient trainees to the PBTE approach.
5. Supporting instructional resources, including printed materials, multi-media materials, etc., need to be developed.
6. Supporting facilities needed include a resource center, videotaping studio, viewing room, conference rooms.
7. The resource person is an integral and essential component of the system. The resource person acts as advisor, helper, coordinator, and evaluator.
8. A resource person's guide helps the teacher educator to function in a new and perhaps unfamiliar role.
9. The implementation guide assists in the processes of organizing and managing the PBTE program.
10. Actual school classrooms are essential for the final demonstrated performance of the competency.

MODULE EVALUATION

Evaluation of the Center's materials is a continuous process. It begins as the modules are conceptualized and continues as the modules are designed, developed, field tested, and implemented in a teacher education program. Input from evaluation may be informal and subjective, or formal and empirical. Ideally, evaluation is a never-ending effort.

Each curriculum designer should develop evaluative criteria based on the underlying educational philosophy and approach of the performance-based teacher education in which he or she is working. Many criteria,

however, will be common to all PBTE instructional materials. The three evaluation instruments in Appendixes A, B, and C have proven useful in materials-development projects and may be adapted by program constructors to fit their particular needs. The first (Appendix A) asks broad questions about the bases and content on which the module is constructed. The second (Appendix B) is a more specific checklist, designed to focus on each element of the module. The third (Appendix C) is a very detailed device that may be especially useful in the final refinement stages of module development.

Appendix A. Evaluation of Performance-Based Instructional Packages

1. Is it competency based?

   a. Does the terminal objective require actual performance of a task or tasks of the occupation?

   b. Is there a series of explicitly stated objectives leading to the terminal performance?

2. Does it treat the "Why" and "How" of the performance?

3. Do the learning experiences deliver on the objective?

   a. Is there a series of logically sequenced learning experiences leading to performance of the actual task or tasks?

   b. Are the learning activities reasonable expectations considering demands for physical resources, student time, and resource person time?

4. Does it culminate with assessment of actual performance with a comprehensive listing of performance criteria provided?

5. Does it contain clearly stated, easy to follow directions?

6. Is flexibility provided for the student to select learning experiences appropriate to individual needs?

7. Does it have a high degree of utility--can it realistically be implemented in the field?

8. Is it attractive?

Appendix B. Module Assessment Checklist

MODULE NO._____ MODULE TITLE:_____

ELEMENTS	YES	NO	?	COMMENTS
1. The introduction:				1.
a. describes what the student will learn.				a.
b. tells the student why the competency is needed.				b.
2. The directions are correct and explicit.				2.
3. The objectives are correctly stated.				3.
4. The learning activities:				4.
a. are consistent with the objectives.				a.
b. provide sufficient opportunity for the student to learn.				b.
c. are practicable and feasible.				c.
d. are appropriate to the student level.				d.
e. are clearly and succinctly stated.				e.
f. include a variety of learning modes.				f.
g. are limited to the necessary knowledge and skills.				g.
h. are free from harmful side effects.				h.
i. are largely self-instructional.				i.
j. provide student reinforcement.				j.
k. provide practice of skills in controlled settings.				k.
l. provide simulated or real-world tryout of competency.				l.
5. Student self-checks:				5.
a. are directly related to the objective				a.

ELEMENTS	YES	NO	?	COMMENTS
b. cover the required knowledge				b.
c. provide the student with feedback				c.
6. The <u>instruction sheets</u>:				6.
a. are clearly and correctly titled.				a.
b. are written at the student's level.				b.
c. provide the essential information.				c.
d. include appropriate instructional illustrations.				d.
e. are adequate in scope and depth.				e.
7. The <u>instructor's final checklist</u>:				7.
a. is in correct format.				a.
b. measures student acheivement of the module objectives.				b.
c. is limited to the competencies stated in the objective.				c.
d. states the desired performance in unambiguous terms.				d.
e. is based on observable student performance or the product of performance.				e.

Appendix C. Module Review Checklist

MODULE TITLE:_____ REVIEWED BY:_____

Language

1. The terminology is defined in the introduction or information sheets. YES NO

2. The terminology is consistent throughout. YES NO

3. The directions are simply and clearly stated, and complete. YES NO

4. The performance objectives are stated in measurable terms. YES NO

5. The directions clarify the performance objectives; they are not simply a restatement of the performance objectives. YES NO

6. The directions clarify what the performance is, how to do it, and why it is necessary. YES NO

7. The language is lively and interesting; it is not merely mechanical. YES NO

8. The language is geared to the level of an average reader. YES NO

Learning Experiences

1. Learning experiences are sequenced logically. YES NO

2. Learning experiences do not overlap. YES NO

3. Learning experiences lead to competency in the performance objective. YES NO

4. All required readings contribute directly to attaining the objective. YES NO

5. All required activities contribute directly to attaining the objective. YES NO

6. When an activity may be difficult to implement, alternate ways of completing the activity are provided. YES NO

7. Optional learning activities are provided to give depth and flexibility to the learning experience. YES NO

8. A range of activities is provided to accommodate students of different abilities, needs, and interests. YES NO

9. A range of activities is provided to allow for both individual and group work. YES NO

10. Role playing activities include role descriptions and situations to guide anyone playing a role outside his/her own frame of reference. YES NO

11. The learning activities are varied and interesting, with a minimum of repetition from one learning experience to another. YES NO

Information Sheets (Criteria in the "Language" section apply here)

1. The module is self-contained, if possible, and practical. YES NO

2. Information sheets contain up-to-date information. YES NO

3. Information sheets are concrete and tangible, not just vague generalities or lists of criteria; they tell "how-to." YES NO

4. Information sheets are relevant to vocational education, with examples drawn from various service areas of vocational education. YES NO

5. Outside resources require less than 30 pages of reading per learning experience. YES NO

6. Outside resources are not more than 10 years old (unless they are of exceptional value). YES NO

7. There are three or fewer outside references per learning experience. YES NO

8. Outside references are standard enough that they should be readily available to any module user. YES NO

Self-Checks, Model Answers, Checklists

1. Self-checks are not simply rote activities, and are not obvious without the information provided in the learning experience. YES NO

2. Self-checks comprehensively reflect the information provided in the learning experience. YES NO

3. Model answers (which do more than parrot the information in the readings) are provided to reinforce learning. YES NO

4. Checklists are stated in observable, performance terms. YES NO

5. Checklists include all criteria necessary for successful performance. YES NO

6. Checklists actually assess the learner's progress toward the objective. YES NO

7. Alternatives to peer evaluation are provided for those learners who cannot arrange to work with peers. YES NO

8. Each feedback device includes a stated level of performance. YES NO

9. Evaluations provide for recycling if the level of performance is not met. YES NO

Media

1. The media is applicable to all vocational service areas. YES NO

2. The media illustrates, clarifies, reinforces, or extends the concepts introduced in the module; it doesn't simply repeat them. YES NO

3. The media is realistic, i.e., the teacher, students and real school setting are believable. YES NO

4. The length of the media is reasonable (10 to 20 minutes). YES NO

5. The media is interesting visually/aurally. YES NO

6. The media is clear visually/aurally. YES NO

7. If the media includes an exemplary instructor, the instructor:

   a. relates well with students. YES NO

   b. uses student feedback. YES NO

   c. uses media or teaching aids where appropriate. YES NO

   d. presents information geared to the needs of the students. YES NO

   e. teaches on the basis of up-to-date learning theory. YES NO

8. The media is free from racial and sex bias. YES NO

9. The media is lively and action-oriented. YES NO

10. The information is presented in a logical manner. YES NO

Overall

1. The module delivers on the objectives. YES NO

2. The module meets "new format" specifications. YES NO

3. Module is internally consistent (objs., directions, feedback devices, etc. do not contradict each other, directly or indirectly). YES NO

4. No learning experience other than the final learning experience requires performance in a real school situation. YES NO

5. Opportunity is provided for practicing any performance which must be executed in the real world. YES NO

6. The final learning experience requires performance in an actual school situation. YES NO

7. The learning experiences are realistic; i.e., they do not require an unreasonable amount of prior knowledge or of time on the part of the learner. YES NO

8. The module is easy to implement; i.e., it does not require an unreasonable amount of the resource person's time. YES NO

9. Learning activities, information sheets, case studies, resources, etc. provide across-the-board representation of the various service areas in vocational education. YES NO

10. An introductory statement is provided which motivates the student by explaining why the competency is needed, not simply what the competency consists of. YES NO

11. An introductory statement is provided which places the module in a frame of reference with other modules in the category, and with the broad theory of vocational education. YES NO

12. All necessary prerequisite competencies are listed. YES NO

Occupational Education Programs
University of Michigan

DELIVERING LEARNING/TEACHING FOR COMPETENCY-BASED EDUCATION

INTRODUCTION

A cursory review of the previous papers indicated that "Competency-Based Teacher Education: A National Perspective," "Competency-Based Programs and Materials for Vocational Teacher Education," and "Service Area Focus on Competency-Based Teacher Education" have been addressed. This particular paper and the paper which follows address the knowledges, skills, and hopefully attitudes necessary for the development of competency-based teacher education materials.

This paper may best be described in terms of eight questions. The questions are: (1) What are Vogler's CBE perspectives? (2) What is CBE? (3) What are the products of CBE? (4) What are the functional components of CBE? (5) What is learning/teaching? (6) What is the delivery strategy? (7) What is the jargon? and, (8) What is the function of a module?

WHAT ARE VOGLER'S CBE PERSPECTIVES?

Most existing teacher education programs have evolved over time. The teacher educator's interests, textbooks, teacher certification requirements, college degree requirements, inherited course syllabi, and a multitude of other variables have contributed to this evolution. All too often the variables have had little to do with the knowledge, skills, and attitudes required by teachers. Thus, the teacher education curriculum has often addressed teacher competencies through happenstance rather than by design.

One alternative to a happenstance curriculum is to utilize competencies in the development of professional teacher education programs. In 1971, The University of Michigan embarked upon such a project to develop a teacher education program utilizing competencies as a foundation. The project was funded by the State of Michigan, Department of Education, Division of Vocational-Technical Education Services. This developmental project resulted in an operational, competency-based, upper-division, comprehensive occupational teacher education program. Graduates of the program exited with a Bachelor of Science degree in education; provisional, general certification; and provisional, vocational certification, with each prepared to teach his or her vocational area.

A residual outcome of this project has been the development of a personal perspective on competency-based education. The perspective can best be indicated by the following five observations related to competency-based education.

1. Teacher education curriculum developers and implementors often expect too much from competencies, goal statements, and performance objectives. These components are communication devices. To expect more from them than communication will lead to serious problems.
2. The delivery of learning experiences by modules has often been considered the singular system for providing the non-field based instruction. Although a modular option is very desirable, it should only be an option. Other delivery systems, including traditional group instruction, may be more appropriate for a given situation. Further, adoption

of a modular competency-based delivery system would be unrealistic at this time. The current materials available to deliver a modular system are limited. Although materials could be purchased, the materials would require revision for specific situations. Finally, to expect that all students learn best under a modular system would be as much in error as to believe that all students learn best with traditional systems.

3. Followers of CBTE often believe that the evaluation problems of teacher education will be solved with a competency-based approach. The performance objectives with criteria of reference provide an excellent means of communicating the evaluation intentions. However, the mechanics of evaluation for a large group of objectives and a large group of students are huge. The problem is magnified when consideration is given to other variables. Example variables include assessing students upon entry, measuring durability of competence, relating competence to teacher certification, recycling current or returning students, evaluating field-based competence, and determining psychomotor and affective competence.

4. The emphasis in a competency-based program often shifts to exit requirements. Although this is very appropriate and consistent with the competency-based model, reality suggests that attention must also be given to entrance requirements. The expertise to accurately evaluate a prospective teacher

does not exist. Thus, the student ratio of entrance to exit remains out of balance, and a tendency to permit incompetence prevails.

5. Administrative decision makers often believe that a competency-based program will reduce the number of teacher educators while increasing the number of teachers prepared. Teacher educator aides can relieve the teacher educator of certain duties. Modules can replace scheduled classes. Cooperating teachers can assume more responsibilities in teacher education. However, the nucleus of a good teacher education program is dependent upon low teacher/student ratios and student access to the expert teacher educator.

WHAT IS CBE?

Competency-based education is equal to performance-based education. Competency-based teacher education is equal to performance-based teacher education and is one example of competency-based education. Competency-based teacher education does not have sole rights on the whole competency-based education movement. Competency-based teacher education is only one example of the total movement. Hopefully, competency-based teacher education can spawn teachers who will be competency-based in their operations. To put it differently, one should not be concerned with which came first--the chicken or the egg. The important point is to have a chicken capable of producing eggs. The remarks that follow should be applicable to both CBE and CBTE.

A more direct and less circular double talk definition of competency-based education might sound something like this: the organizational

structure of learning/teaching which permits description in advance of the knowledges, skills, and attitudes that a student should possess upon exit from a program or course.

WHAT ARE THE PRODUCTS OF CBE?

Historically, teachers have assumed the authority and the responsibility for the learning/teaching environment. The result has been a teacher-centered approach to education. Competency-based education can produce four outcomes that would be more closely aligned to student-centered education. The four CBE products are: (1) a shift of responsibility from the teacher to the student, (2) a shift of emphasis from learning process to learning outcome, (3) a clarification of instructional intent, and (4) setting of the stage for evaluation. The interface and importance of these four products will emerge through responses to the remaining advance organization questions of this presentation.

WHAT ARE FUNCTIONAL COMPONENTS OF CBE?

The functional components of competency-based education may be divided into two categories. The first category is an advanced organizer or communication device. Goals, competencies, performance objectives, and syllabi comprise the category. All four devices should be developed in the planning stages of education.

The second category of functional components of competency-based education is the delivery strategy system. This category includes learning/teaching experiences and criterion-referenced testing. The category equates to the implementation phase of education. CBE learning/teaching

experiences may emanate from group, individualized, and combination strategies. The latter strategy may utilize both small groups and individualized instructional packages. The learning/teaching strategy will be elaborated in a following section of this presentation.

Criterion-referenced testing is the ultimate CBE tool for it requires that the performances of students be compared to standards specified in performance objectives. Upon completion of criterion-referenced testing, the development/implementation loop is completed.

WHAT IS LEARNING/TEACHING?

Learning/teaching may best be described using the problem-solving model. This model is comprised of five basic questions: Where am I now? Where am I going? Why am I going? How am I going to get there? How do I know when I'm there? The words "student" or "teacher" may be substituted for the word "I." Thus, the model becomes: Where is the student going now? Where is the student going? Why is the student going? How is the student going to get there? How does the student know when he is there? Likewise, the model may read: Where is the teacher now? Where is the teacher going? Why is the teacher going? How is the teacher going to get there? How does the teacher know when the teacher is there?

The substitution of the word "teacher" or "student" into the problem-solving model makes it consistent with the products and the components of CBE. To illustrate, the student problem-solving model provides for the shift of responsibility to the student. The emphasis shifts to student learning outcomes; and therefore, the instructional intent is

clarified. Finally, the notion of how does the student know when he is there sets the stage for evaluation.

The teacher problem-solving model is consistent with CBE in that the components of CBE require advance organizers. As noted earlier, the CBE advanced organizers are goals, competencies, performance objectives, and syllabi. The natural consequence is a problem-solving process which is complementary to CBE.

WHAT IS THE DELIVERY STRATEGY?

Traditionally, learning/teaching has been provided in the group setting. The teacher is the authority figure and usually is placed at the front and center of the group. An alternative for teacher-centered instruction is student-centered instruction. This can be facilitated by self-contained learning/teaching tools called modules. Both strategies have their advantages and disadvantages. Consequently, a third learning/teaching strategy can evolve which is a combination system. The combination strategy permits the use of either group techniques or individualized techniques. Further, the combination strategy retains the large group instructional option.

The tools for group, individualized, and combination strategies are units, modules, and Mo-Uns. Group instruction usually is organized by units which break into lesson plans. Individualized instruction is usually organized into modules. The format and components will be addressed in the "Writing a CBE Module" presentation. The combination instruction may be organized into a device, which for lack of a better word, is called a Mo-Un. A Mo-Un utilizes the first two letters of module

and the first two letters of unit, and in practice uses both lesson plans and modules. Figure 1 illustrates the group, individual, and combination delivery strategies. Figure 1 further identifies the learning/teaching delivery tools.

Figure 1. CBE Delivery Strategies

WHAT IS THE JARGON?

Professors keep their jobs by inventing new words for use with old definitions. Several professors have been fully employed in the development of CBE. They have brought in special definitions of modules, mo-uns, goals, performance objectives, pre-assessment, post-assessment, criterion of reference, criterion-reference testing, and many others. As one moves through CBE materials, one will have questions regarding the definitions. The safest approach is to use common sense and to accept the idea that there appears to be no one right definition for any of the terms. Therefore, you are given the license to be creative and to define and invent your own new words.

WHAT IS THE FUNCTION OF A MODULE?

Modules may be defined as self-contained learning/teaching tools. The module may be used in the individualized or in the combination strategy. The module is the crucial element for individualized or combination strategy. Therefore, the importance of modules and the ability to write them becomes paramount.

The module functions are illustrated in Figure 2. One should note that the ultimate function of modules is flexibility for the presentation of instructional content.

SUMMARY

This paper has briefly addressed eight questions related to "Delivering Learning/Teaching for CBE." Scrutiny of the information permits one to deduce that CBE is consistent with contemporary learning/teaching theory and principles. CBE mandates a planning and execution scheme which is in harmony. Finally, CBE affords an opportunity for progressive change in education.

Occupational Education Programs
University of Michigan

WRITING COMPETENCY-BASED EDUCATION MODULES

Eight basic questions provide the background information for writing CBE modules. They are: (1) What are the functional components of a module? (2) What is the cover page function (3) What is the introduction function? (4) What is performance objective function? (5) What is pre-assessment function? (6) What is learning experience function? (7) What is post-assessment function? (8) What is the reference function?

WHAT ARE THE FUNCTIONAL COMPONENTS OF A MODULE?

There are an infinite variety of formats for modules; however, a workable format must move the learner logically and sequentially through a series of events that will enable the learner to meet specified performance objective(s). An ultimate test of a module in terms of whether or not it delivers is the problem-solving model. One may test any module against whether or not the learner knows where he is now, where he is going, why he is going, how he is going to get there, and does he know when he has arrived. To accomplish this, the following skeletal format for modules is offered:

Cover Page
Introduction
Performance Objective
Pre-Assessment
Learning Experiences
Post-Assessment
References

WHAT IS THE COVER PAGE FUNCTION?

In the final analysis, the cover page function must be able to communicate and to attract the attention of the learner. This may be accomplished if four basic components are included: title, content table, prerequisites, and directions.

The title communicates active learning by adding an "ing" to the performance element action verb. For instance, the performance element "write a lesson plan" becomes the title "Writing a Lesson Plan." The second option, to thrust the title into an action form, is to change the performance element of the performance objective into a question. The performance element "write a lesson plan" might well become "How Do You Write a Lesson Plan?"

The second component of the module cover page should be a content table. It will serve as an advance organizer for the total module. The content table should include a listing of the format pagination. Thereby, a reader could scan the content table and then turn to the specific parts. The content table is particularly important for both the novice who is picking up a module for the first time and for the experienced module user who strives for learning efficiency.

The prerequisites component should also be identified on the cover page. Prerequisites should communicate to the learner the knowledges, skills, and attitudes necessary to enter the module. Basically, the prerequisites should be kept to a minimum; and, "no prerequisites" is a very distinct possibility. Prerequisites may be previous modules, a previous course, or a variety of other previous experiences. The ultimate prerequisite statement should enable the learner to decide whether he is

ready for the module. However, the module should also test the learner for prerequisite competence.

The directions component should also be provided on the cover page. The directions are learning routes for the learner. Directions are not only needed on this page but should also be added at the end of each section within the module. Well developed module directions will weave the student efficiently toward competence.

WHAT IS THE INTRODUCTION FUNCTION?

The introduction to a module will usually follow the cover page and serves one primary purpose—to address the problem-solving model question, "Why is it important?" The "why" answer must be evident to the learner upon completion of the introduction. "Why" answers create interest, establish basic assumptions, and encourage the learner to set goals.

The introduction can accomplish interest creation if it arouses curiosity; is brief, clever, or stimulating; uses visuals, provides expectation of meaningfulness, looks like fun; or creates competition. These characteristics can also be used as a checklist for whether or not interest has been created and if "why" questions have been answered.

WHAT IS THE PERFORMANCE OBJECTIVE FUNCTION?

Performance objective must provide the pivot point for the entire module. Like all performance objectives, the module performance objectives must specify the learner outcomes, identify the conditions under which the performance should occur, and establish assessment standards.

The performance objectives used within a module may be terminal and/or enabling. It is essential that a terminal performance objective be identified. The terminal performance objective should receive a prominent place following the introduction. Enabling performance objectives may be provided as a process device and usually are clustered in groups of two or more. If the enabling objectives are accomplished, then the terminal performance objective will be accomplished. By indenting, one may locate enabling performance objectives on the same page with the terminal objectives. Enabling performance objectives are often placed as the headings for learning experience sections.

WHAT IS PRE-ASSESSMENT FUNCTION?

The pre-assessment function is provided in modules for two basic reasons. First, it provides the prerequisite test option. To illustrate, if a module has a prerequisite, then the prerequisite must be tested. The prerequisite may be tested by paper-and-pencil tests or any other means which provide evidence that one has met the module entrance requirements.

The second reason for a pre-assessment is to permit skipping part or all of the module. This pre-assessment option allows the student to move in jumps or skips throughout the module. The jump or the skip will be based upon demonstrated competence. This option is often called <u>exemption testing</u>. A convenient and efficient means of pre-assessment for the total skip option is to utilize the post-assessment as the pre-assessment.

The pre-assessment function also provides some opportunities for the learner. It helps the learner make decisions, allows the learner to self-pace, and serves as a learner diagnostic tool. The pre-assessment may also interface with the introduction by arousing curiosity. Finally, one should not be concerned about overusing pre-assessments. Pre-assessments are probably the most natural, non-threatening, learning device available.

WHAT IS THE LEARNING EXPERIENCE FUNCTION?

The learning experiences provide the meat of the module. Learning experiences permit the learner to accomplish the performance objectives. The learning experiences section divide and sequence the learning activities. Learning experiences cannot be undersold as a component of the module. All other module parts merely lead to or assess benefits of learning experiences.

The learning experience section should provide variety. It may be self-contained and should appeal to several senses, not just learning through reading. The section must include assessment, and may require supplemental information sheets. It should be domain consistent. In other words, the learning experience in a cognitive area should relate to a cognitive performance objective.

The learning experiences may include both crucial and enrichment learning experiences. However, all learning experiences should be action oriented. If these options can be provided within the learning experience section, the section will be a success.

WHAT IS THE POST-ASSESSMENT FUNCTION?

The post-assessment must test exit competence and facilitate criteria-referencing. It may deliver a comp-out option and may diagnose competency voids. Ideally, the post-assessment will close the learning/teaching loop.

The post-assessment function may be simplified if several procedural points are followed. First, sampling may be used for testing knowledges, skills, and attitudes. Secondly, post-assessment need not go beyond the levels of the performance objective; and thirdly, it is essential that one test enough performances and collect enough data to be satisfied that competence has been achieved.

WHAT IS THE REFERENCE FUNCTION?

The reference function exists as a finalizing effort within the module. It should give credit for any materials, works, or ideas utilized within the module. The reference section should identify special resources needed to satisfactorily complete the module. It provides a listing of resources that would help facilitate the module facilitator in preparing for execution of the module. Finally, the reference section should prevent copywrite suits and keep one out of jail.

SUMMARY

The functional components of a module have been presented. Writing a module can be a rather simple task when the information provided earlier is mastered. However, the parts of a module should not be written in the

same order as they are presented in the module. Figure 1 lists the final format and the developmental order for a CBE module. Basic content checks are included. One should bear in mind that this is just one format. There are infinite variations.

Figure 2 provides a critique system for modules. Note that the system incorporates the problem-solving model.

FINAL FORMAT	DEVELOPMENTAL ORDER
Cover Page	-
title	7
content table	10
prerequisites	2
directions for module	9
Introduction	4
answer "why"	-
PERFORMANCE OBJECTIVE - TERMINAL	1
optional enabling P.O.(s)	
Pre-Assessment	-

Figure 1. Format and Development of CBE Modules

HINT: Take at least seven sheets of paper and label each sheet with one of the above headings. Do what is required for each heading in the order listed under the DEVELOPMENTAL ORDER. When you have completed the first eight steps, shift your papers into the FINAL FORMAT and then write your directions and content table. Naturally, the number of module pages will vary. You will, no doubt, desire to revise after this point. Good luck!

CONCERNS IN THE IMPLEMENTATION OF COMPETENCY-BASED TEACHER EDUCATION

Martha Lee Blankenship
Professor of Home Economics Education
Marshall University

CONCERNS IN THE IMPLEMENTATION OF COMPETENCY-BASED TEACHER EDUCATION

When first introduced to competency-based teacher education (CBTE) one might state: "That sounds like a fine idea, but how can I ever put it into effect in my own institution." It is difficult to implement unless adequate resources are provided. Persons working with programs in brand new institutions may find the implementation process to be easier than to change a program already in existence. The time seems right for implementation of CBTE, however, as impetus for change is coming from many directions. The major concerns for implementation are: (1) program development, (2) flexibility of time, (3) standards and progress reporting, (4) materials, equipment, and facilities, and (5) staffing. These concerns will be discussed in the paragraphs which follow.

PROGRAM DEVELOPMENT

Two major routes may be taken in program development. The first route involves developing the entire CBTE program before beginning to use it, while the second route is to move gradually into using the CBTE program as it is developed. There are advantages and disadvantages associated with each route.

The major advantage of developing the entire program first is that it is a more orderly procedure. Materials are ready for students, and students know what to expect since objectives and requirements are neatly laid out. Major disadvantages are: (1) it is difficult to obtain sufficient feedback during development concerning how procedures will work,

(2) staff members are often teaching the old program while developing the new, and (3) waiting until the whole program is completely developed may mean that it is never completed.

If a decision is made to take the second route and implement the program as it is developed, it is very important that competencies be clearly defined in the beginning. Otherwise, a faculty may find it very easy to arrive at an unexpected destination.

It is possible to begin teaching a course for which competencies are defined and then develop performance objectives for each new set or cluster of competencies as one progresses; it is much easier for everyone, however, if the objectives are also written before the course begins. The second route was used in converting a methods class to CBTE. The procedures are explained below:

First Semester

A. Identify competencies
B. Develop performance objectives
C. Develop criterion tests
D. Continue group instruction
E. Continue norm-referenced grading

Second Semester

A. Refine objectives and criterion tests
B. Provide self-tests for students
C. Develop retests as needed
D. Switch to criterion-referenced grading
E. Provide as much remedial work as possible

Third Semester

A. Determine how content should be divided into modules
B. Develop some self-instructional modules
C. Fill in the gaps with group instruction

Fourth Semester

A. Provide a list of self-instructional modules and objectives at beginning of semester
B. Complete self-instructional modules as needed by students

Fifth Semester

A. Revise suggested time frame
B. Refine materials and procedures

The time required to make this transition to CBTE using the second route will obviously depend on prior experience of the program developer and the amount of time available. The procedure described is not suggested as a model to follow but simply as a possible plan. The steps are not as discrete from one semester to the next as the outline may suggest.

Advantages in using the second route include: (a) instructor receives more immediate feedback on progress, (b) added impetus to keep developing the program once materials are promised to students, (c) students can begin reaping the benefits from some of the changes sooner, and (d) students do not have to make sudden changes--there seems to be a remarkable grapevine concerning what to expect in a particular course.

Disadvantages are that (a) deficiencies at certain stages are more apparent to both students and instructors, (b) time pressures may mean that materials are sometimes quite rough, and (c) students may feel somewhat in limbo as changes are occurring.

If released time can be provided it is recommended that the entire program be developed before implementation. This route may also be feasible if there is a group effort. In the absence of the above two conditions, choose the second alternative, simultaneous development and

implementation. It is recommended that a realistic time schedule be planned for the development and implementation of the CBTE program.

FLEXIBILITY OF TIME

The second major concern is time flexibility. Although one of the major tenents of CBTE is that learners can progress at their own rate, most are locked into a fixed time frame which assumes that all learners progress at the same rate. Even when instructors manage to achieve time flexibility within a particular course, a fixed time frame within a course may still exist.

All institutions may not find the same solution to the problem. It is recommended that an individual examine the regulations in the institution within which they plan to implement CBTE for safety valves to use in order to provide flexibility.

TIME FLEXIBILITY ACROSS COURSES

In an attempt to provide time flexibility some institutions have awarded variable credit at the end of the semester depending on amount of work completed. Marshall University had such a proposal reviewed several years ago that received considerable support. The plan was not approved, but more flexibility has been accomplished.

Another method of providing flexibility may be accomplished by letting students withdraw without penalty from a course just prior to semester exams. Students may pick up where they left off when they re-enroll if they have completed a sizeable portion of the work successfully.

There has been a very low withdrawal rate from classes when using the CBTE approach at Marshall University. Time pressures toward the end of the semester have sometimes been severe for certain students, but most finish. One or two students may withdraw during the first three weeks, but these same students often withdraw from school before the semester is over.

A second safety valve may be provided by giving incompletes. At Marshall University this safety valve opens easier at the graduate level than at the undergraduate level. Another safety valve that is already available on most campuses is to advise students who work more slowly to carry a lighter course load. One student may carry 21 semester hours and another only 9 or 10. Both students could be meeting requirements.

Examine the system to see what loopholes may be found in providing for time flexibility. When it has been proven that the CBTE system works, college and university policies may be changed to permit legitimate flexibility.

TIME FLEXIBILITY WITHIN COURSES

Theoretically, students should be able to work through course objectives completely at their own rate. Practically, guidelines must be set in view of an arbitrary completion date. The suggested completion time for modules may be changed each semester depending upon time required by previous students in the program. One class may set the pace by completing the first two-thirds of the modules ahead of a suggested schedule. The severe end-of-semester pressures may be avoided by an early completion.

Criterion tests may be rescheduled if students request it. Students may ask for tests earlier, sometimes later, depending on other time demands. In the home economics program at Marshall University, students do not take the criterion test with the remainder of the class if they are completely unprepared. There is considerable latitude as to when students must complete a particular test with an acceptable score. About halfway through the course, students complete all work up to a certain point. This procedure accomplishes two things: it helps students pace their work and makes the job of teacher possible. By mid-term, the teacher may pull retests for about 15 or 20 different criterion tests. It is difficult to deal with that many retests at one time with the amount of time and help teacher educators usually have available.

CBTE permits flexible use of class time rather than requiring it once the evaluation system is dealt with. Even though a class is scheduled three hours a week, it may not always meet. Part of the time may be used for individual conferences; some days may be used for criterion tests; some for retests; and some for special help. Occasionally, filmstrips or slides could be shown during class time;but students are not penalized if they prefer to see them at another time or if they choose a reading instead. A class discussion may be scheduled on topics as students indicate the need.

STANDARDS AND PROGRESS REPORTING

The third major concern is grading and progress reporting. Teachers will find themselves in a dilemma as most are required to report letter grades. Some institutions have initiated a policy permitting students

to take a certain number of credits on a pass/fail basis for about five years and, more recently, students have been allowed to take a few courses outside of their major field on this basis. Reactions are mixed and a return may be made to giving letter grades for student teaching. Supervising teachers other than those in home economics have indicated that student teachers don't work as hard. Studies from other institutions have indicated that achievement is lower with pass/fail. A CBTE type of program stimulates more effort among students whether or not letter grades are given. No data supports this claim, but informal observation over a several year period influences the author's belief. The microteaching program was an experiment begun in the fall of 1969. It was so successful that the efforts were expanded in that direction. Until last year, students received no letter grade as the experience was simply listed as a requirement for other courses. Students came to their microteaching session even when they missed all other classes the same day. The constant feedback students received really made final letter grades unnecessary. The experience was attached to other classes. Actually, one year a microteaching experience was operated for 24 clock hours that wasn't attached to anything. Students simply had to meet the requirement. Students who were enrolled in an Educational Foundations class substituted this experience for a live observation in the public schools. When EDF dropped the laboratory requirement, our students completed the experience even though they received neither grades nor credit. Two one-hour courses were later added to our program which included microteaching.

Advocates of letter grades maintain that grades stimulate effort. This use of grades may teach students to work for the external reward. It

is preferable for students to find satisfaction in working to meet specified standards and eventually set their own standards of performance. A couple of years ago when supervising teachers sent mid-term progress reports for student teachers, one teacher responded to the question concerning weaknesses by saying that the student teacher was working too hard. That is the kind of weakness one likes to hear about.

Abolishing letter grades would make very little difference in student effort and achievement. Many of the achievement comparisons have been made in either elective or general education courses with passing meaning a D or better. If all a student has to do is pass with a D, he/she isn't likely to exert much effort. Making a D isn't good enough in a major subject or in professional education. Students must maintain a C average in general education, in professional education and in their major. This policy is better than just an overall C average, but making a B in an Educational Foundations class and a D in Methods does not guarantee success in teaching. A CBTE program permits the maintenance of standards for each course and each competency.

Grades are not necessary, but if necessary can be awarded. In evolving a system for awarding grades with CBTE, there are several changes in thinking that must be made. The first change is to forget about the normal curve. The second concerns letting superior achievement on one competency average out with marginal achievement on another competency. Another change is to stop considering the score on a particular criterion evaluation as final.

One educator has justified abolishing the concept of the normal curve on the basis that the normal curve occurs by chance. Since education is

supposed to be intentional rather than a chance occurrence, why should we expect a normal distribution of grades? The range of grades that occur are likely to reflect the standards set. Thus if 70 per cent standards for objectives are set, some D grades may be expected. If 85 per cent standards are set, only A and B grades will be made if all students meet requirements. Students will meet whatever expectations are set forth in objectives if a system is devised whereby the first effort to master a competency is not necessarily the last opportunity.

There are two basic ways to differentiate among letter grades with CBTE programs. First, vary the standard of achievement required. Second, vary the number of competencies. For undergraduate courses, the first pattern may be used. Adding additional competencies for an A does not seem feasible considering the extent of basic requirements. For graduate courses, the second pattern is frequently used with varying requirements, or a combination of varying requirements and varying standards. Contracts work quite well with graduate students. Students may contract for grades on the basis of both scores and number of modules completed. Stipulations may be built in relating to pretest scores so that students can test out of modules. If students choose to complete a module that they tested out of at a B level, they are required to improve the posttest score.

Different patterns were used for contracts last summer with two graduate level workshops. In one workshop, teachers developed learning packages for home management. In order to make a B each teacher developed a specified number of packages of an acceptable quality. For an A, teachers developed a few more packages but they also had to demonstrate competencies relating to reviewing and revising packages. Behaviors had

to demonstrate a contribution to the overall success of the project. In short, teachers earning an A were required to demonstrate certain leadership competencies. In the other workshop, Innovative Teaching Techniques, both the quantity and quality of work varied for different letter grades. For example, participants contracting for an A developed both a simulation and a game, whereas, those contracting for a B developed one or the other. Participants contracting for an A had to achieve higher test scores and also formed review teams to check all products developed. Feedback is used in revising teaching materials.

Although more time is spent with evaluation in a CBTE program, the end of semester trauma is lessened. Participants have either met the standards for an A or they haven't,and there is no mystery involved as to what the requirements are. When contracts are used, students who see that meeting standards for an A is unrealistic are likely to change their contracts voluntarily.

MATERIALS, EQUIPMENT, AND FACILITIES

The main points to consider in relation to A-V equipment for CBTE are: (a) choose equipment that is easy to use; (b) have equipment readily accessible to students; (c) single-purpose rather than dual-purpose equipment permits more students to work at one time; (d) the smaller size in A-V equipment is a space saver; and (e) earphones reduce the noise level. An additional point is that early mastery of competencies relating to use of A-V equipment is essential if participants are to be able to use the equipment for self-instruction.

Materials for CBTE present a two-pronged problem. Finding suitable resource material is difficult as traditional textbooks seldom meet the demand. The second part of the problem is making the material available to students. It may be found that existing materials either provide only a superficial coverage of topics or they assume prior knowledge the beginner does not have. Thus, it is often necessary to write self-instructional modules and then write the missing supporting material. Even when good material is available on a topic it is likely to come from a dozen different sources including books, brochures, pamphlets, journals, conference reports, and curriculum guides. Non-profit media is not available on many topics. Since many of the resources are not of the type that can be neatly cataloged and placed on a library shelf, labeled boxes will help keep material in some semblance of order and enable participants to find what they need. Color coding and other symbolic coding (usually coinciding with the code for modules) also helps. As a long range solution it may be necessary to write texts specifically designed to accompany modules in order to reduce the sheer volume of resources that are required. Students also seem to like self-contained modules which have the supporting material included.

STAFFING

We all remember the furor several years ago when educators feared that teaching machines would replace teachers. Not much is heard about that concern any more—instructors are busier than ever as they move into CBTE. For one thing, the minute the challenge is accepted that all participants will achieve a pre-specified level of mastery, the teacher is

busier than ever. In another five years the work will ease off; the system will be operating smoothly and the materials will be developed. A major aspect of the CBTE system is the feedback loop. How is the system working? Have conditions changed which require new competencies? What other improvements are needed?

Most of the individuals who decide to develop or continue a CBTE program will probably spend a major part of their time in program development. The amount of time devoted will depend largely on the amount of assistance received from other persons during implementation. It may be necessary to delegate implementation of some favorite activity to other persons if time is found for program development.

An assistant may assume the responsibility for administering criterion tests, grading, and recording scores. The responsibility for test development and for checking work that cannot be scored by an inflexible key must also be assumed by someone. Assistants can help with assembling, distributing, and filing materials. Training assistants is a never-ending process as many are temporary staff. Furthermore, the tasks to be done change from year to year during program development.

It has been said that the true success of an innovation can be judged only by the success persons other than the original developer have in implementing it. Innovative programs have been known to collapse when the developer moved on. CBTE is a rather grandiose scheme which ties together a number of educational innovations.

It often seems easier to develop a program and then find persons to help implement it. Broader involvement in the original development will help insure that the program is carried out as intended. As new personnel

join the staff, it is very important to help them understand the overall philosophy of the program as well as specified procedures. This broader understanding often influences how faithfully day-to-day procedures are carried out and the kind of adjustments that are made.

Educators have stopped talking about teacher-proof curriculum and concede there is probably no such thing. At first glance, CBTE might appear to be teacher-proof. It isn't--a million things can go wrong. For instance, an instructor may start awarding grades on the basis of the number of activities performed rather than on achievement. This misses the whole spirit of CBTE. Or consider the matter of pre- and posttesting. Several years ago, someone on our campus developed a module for all secondary education students on the teaching of reading. It seemed to be a great idea, but my students reported that assistants gave the pretest and then showed students what they missed. Since the pre- and posttest were the same, most students went ahead to the posttest with no further study and simply tried another answer for questions they had missed. Obviously, this procedure also missed the point of CBTE as criterion tests usually measure only a sample of the desired behavior. Students learned more about psyching out a test than they did about teaching reading. Our students admitted that they recognized that they missed important learning, but took the easy way out because the system allowed it and there were more pressing demands on their time.

Having another educator attempt to use the material developed does help us pinpoint weaknesses in modules. These weak spots can also be pinpointed if analyzed at points where students require further clari-

fication. As long as we are the only ones using the material, failure to recognize further clarification provided and needed may be overlooked.

Actually, students are the best evaluators of CBTE materials. One problem encountered when having students evaluate the materials is that of getting more data than can be analyzed. Unless assistance in analyzing feedback is provided, a limitation may be made on the number of students providing feedback for each module.

As instruction is individualized, greater and greater demands are made on time. There are certain procedures that can be introduced to share the load and make more efficient use of time. Consider the matter of retests. It is time consuming to permit students to take retests individually. With limited time available, set aside certain times when students can take whatever retests are needed. Students from other classes may also attend at these times. More times for retesting are needed but time pressures prohibit this expansion. One solution would be to make a weekly schedule for retests and make-up work from all classes in the department or division. Each staff member could monitor tests from any class during a specified time period.

SUMMARY

Only a brief discussion has been provided of the many problems associated with implementing CBTE programs. The particular problems faced and the solutions found will differ within each institution. No final answers are given. The program at Marshall University is still groping for answers. Some days the problems seem insurmountable. However, when

a comparison is made with the program as it was before CBTE, the effort seems very much worthwhile.

TOWARD A FRAMEWORK FOR IMPLEMENTING COMPETENCY-BASED TEACHER EDUCATION

TOWARD A FRAMEWORK FOR IMPLEMENTING COMPETENCY-BASED TEACHER EDUCATION

OVERVIEW

The preceding papers have dealt with competency-based teacher education (CBTE) from a most positive point of view. Houston perceives CBTE as having the potential to affect major changes in the field of teacher education. Hamilton and Fairdig provide evidence that there is a great deal of support for CBTE as a relevant movement. Discussions by both Vogler and Blankenship reveal that CBTE can be implemented in a university setting and that it does actually work.

Of course, there is not complete agreement by all teacher educators as to the worth of CBTE. A number of persons have raised serious questions about the nature of CBTE and its ultimate value as a movement. Merrow (1975) points out that CBTE has serious shortcomings in the areas of administration, politics, philosophy, and cost. Nash (1973) has made a strong plea for CBTE to be more humanistic in nature. Merrow and Nash are perhaps representative of those who do not fully support the CBTE movement or who seriously question its basic precepts. These few statements, hopefully, will serve as a cautionary note to anyone who is contemplating the establishment of a CBTE program. While CBTE has garnered much support at national, state, and local levels, it is certainly not all things to all people and must be dealt with in a corresponding manner.

The discussion which follows is based upon the premise that implementing CBTE does not differ markedly from making any curricular change. While it is easy to recognize that CBTE has certain peculiarities, the

business of implementing any new curriculum raises several fundamental concerns. This paper attempts to deal directly with these concerns and incorporate them into a conceptual framework for implementing CBTE. Initially, teacher education curriculum development is discussed. This is followed by the identification of vocational teacher education program types, potential implementation constraints, and implementation options. Finally, a framework is proposed which takes into account these program types, constraints, and options.

CURRICULUM DEVELOPMENT IN TEACHER EDUCATION

Although the curriculum renewal process is quite often associated with secondary and post-secondary vocational education, it seems to become a less frequent occurrence as far as vocational teacher education is concerned. By their very nature, teacher education programs are often constrained by a number of forces such as college course structure, certification requirements, and credit hours. The result has been maintenance of rather traditional teacher education curricula which have not always focused on meeting graduates' professional needs. While vocational education curricula have undergone numerous revisions and modifications so that graduates would be better able to survive in the world of work, many teacher education curricula have not been equally responsive to the needs of their graduates. There is certainly nothing wrong with tradition per se, but it is important that teacher educators examine today's and tomorrow's needs and determine just what sort of curriculum renewal should take place. As Swanson (1974) points out,

> it may be necessary to create entirely new norms or forms of teacher preparation, including the creation of entirely new

types of institutions, to insure that vocational teacher preparation will not operate at the margins of technical competency.

The actual business of teacher education curriculum development should not be thought of as a simple task which can be accomplished in a few days. Rather, it constitutes a major undertaking and represents a strong commitment on the part of professionals and students at all levels. Teacher education curriculum development may be represented by four stages: the need stage, the design stage, the development stage and the implementation stage (Cruickshank, 1971). As Cruickshank indicates:

> During the need stage, the training agency organizes for change and establishes needs and priorities in teacher education curriculum; the design stage includes efforts to identify programmatic thrusts that hypothetically will reduce or eliminate the needs; in the development stage, the training agency seeks to build or adopt new training components and support subsystems; during the implementation stage, the new components and subsystems are tried out.

This process with its four stages has several important implications for teacher education in general and CBTE in particular. First, taken together, the four stages represent a systematic approach to curriculum development. All too often, change is made merely for the sake of change. The four stage process assists in overcoming this sort of difficulty by first identifying what needs actually exist and then proceeding to reduce or eliminate these needs.

A second implication may be drawn from the long-range commitment to change. If the developmental process is to have any lasting value, persons involved in this effort must look at programmatic change rather than merely attempting to find some immediate solution to a complex problem. If, for example, there is a need to develop a vocational teacher education curriculum which will prepare teachers of handicapped students,

plans should be made to deal with both the process of preparing teachers and the impact of newly prepared teachers on their students. While it is recognized that a long-range commitment to curriculum development and study is most difficult to make, the rewards more than offset this extra effort.

A third implication derived from this process is concern for trying out components of the new program and thus insuring that they do make a difference. While it is easy to speculate that students will learn and enjoy their learning, there is no substitute for systematic examination of program operation. The result of such an examination will be useful feedback about the program which may ultimately lead to program refinement.

VOCATIONAL TEACHER EDUCATION PROGRAMS

Within the broad context of teacher education curriculum development, there always exists the specific concern for one's own particular situation. The general and abstract must eventually become specific and concrete if change is ever to take place. Consequently, it becomes important to identify the exact kinds of vocational teacher education programs which might lend themselves to CBTE implementation. While, at first glance, it may appear that vocational teacher education is restricted to teacher education institutions, this is far from the truth. Teacher education institutions do make a substantial contribution to the preparation and upgrading of vocational teachers; however, there are others who may also perform these tasks. In recent years, many local education agencies have taken on a greater responsibility for secondary vocational

teachers' in-service education. Post-secondary institutions (community colleges and technical institutes) have also been moving in the direction of providing their own in-service teacher education. Thus, it may be seen that both teacher education institutions and employers have the responsibility for educating vocational teachers with employers placing a greater emphasis on in-service work.

The different ways that vocational teacher education may be arranged also have importance to CBTE. Some teacher education programs are set up by vocational service area while others are offered on an across-the-board or comprehensive basis. In a number of instances, some core or common offerings are provided to all students with the remainder of course work in each student's teacher education program taken through a specific area. Although the foregoing is common knowledge to many, it has been brought up to point out the range of possible ways that CBTE might be offered. The fact that pre- and in-service vocational teacher education might be offered by a number of different institutions and agencies on an across-the-board basis or by service area points up the need to account for this variation during the CBTE implementation process.

POTENTIAL IMPLEMENTATION CONSTRAINTS[1]

While the actual type of vocational teacher education program may, in itself, be a deterrent to CBTE implementation, there are other potential difficulties which can arise when CBTE is being installed. These

---

[1]For a more detailed discussion about implementation constraints see Finch, Curtis R. and James B. Hamilton, "Performance-Based Teacher Education Curricula: Implications for Programs," in (Anna Gorman, ed.) The Changing Educational Scene. Columbus: The Ohio State University, Center For Vocational Education, 1974.

seem affected to a greater or lesser degree by program type but are also tied closely to the teacher education setting. Five potential constraints which may show up during the CBTE implementation process include: identification of competencies; instructional materials; roles of faculty and students; interaction with various groups, institutions, and agencies; instructional support; and costs (Finch and Hamilton, 1975).

Identification of Competencies

When a competency-based teacher education program is being developed or plans are being formulated for an existing program to move in this direction, a primary concern is with the identification of competencies. Since teacher competencies serve as a foundation for CBTE, errors at this point may result in the establishment of a program that lacks validity. One of the major criticisms leveled at some CBTE programs is that they merely "teach the same (and perhaps irrelevant) content with a new and improved framework (Sinatra, 1973)." The key issue then seems to be that of identifying competencies which actually maximize the probability of teaching success. Closely associated with this issue is the establishment of priorities for competencies. Given a comprehensive listing of valid competencies, how can teacher educators select those which are most beneficial to the student (assuming that institutional or agency constraints do not permit all to be taught)?

Instructional Materials

As an institution or agency moves forward with the business of implementing CBTE, an immediate need is felt to obtain and/or develop

instructional materials. These generally take the form of modules (learning packages) and supporting mediation (e.g., videotapes, films, reference materials). Although there is general agreement among those in CBTE as to what constitutes a module's component parts, several questions may be raised about what it should actually do. For example, does the module "deliver" on a certain important teacher competency or set of competencies? Is it functional and usable? Does it change teacher behavior? What are the effects of modularization on a grand scale? These as well as others are legitimate questions which may be raised about instructional materials that are typically used in a CBTE program.

Roles of Faculty and Students

The roles of faculty and students will most certainly change when a CBTE program is implemented. Or, put another way, if faculty and student roles are not revised the program is probably doomed to failure. One may wrongly assume that change is a relatively simple task. In fact, people (particularly faculty members) may not be receptive to the idea of being involved in "another" new approach to teacher preparation. Faculty may be threatened by the thought of losing a little personal autonomy while students might not relish interacting with instructional packages. Indeed, all who will be associated with a CBTE program can raise meaningful questions about their respective roles.

Interaction With Various Groups, Institutions, and Agencies

Closely aligned with the CBTE movement is the idea of increased interaction with various groups, institutions, and agencies. For example,

competency-based certification being implemented in many states is serving to better align teacher education programs and certification requirements. Much collaborative work will surely need to be done before programs and certification are in alignment. Interaction with local education agencies will, likewise, be increased. CBTE has placed a great deal of emphasis upon field-centered instruction where the student will apply principles learned in an actual school setting. This may include many more instances of "supervised teaching" than would normally be found in a traditional teacher education program. The implications for interaction with local education agencies are obvious, and in some cases, difficult to predict. Logistics associated with field-centered instruction are often extremely complex, especially for universities located in a more rural setting. Generally, areas in which increased interaction is necessary include teacher education institutions, local education agencies, state education agencies, and other interest groups (e.g., NEA, AFT, AVA, NCATE, AACTE).

Instructional Support

In order for any teacher education program to function properly, adequate instruction support must be provided. This may take the form of classroom space, audiovisual equipment, student records systems, resource centers, and similar items.

As with many instructional programs which break with tradition, CBTE requires that support be realigned to fit its unique needs. This realignment is, for the most part, necessitated because of a shift from traditional practices to mastery learning and individualized instruction.

Since students will be learning at their own particular rates and demonstrated competence (rather than grades) serve as records of assessment, facilities must be available to meet their particular needs. Typically, a CBTE resource center that contains relevant resources such as references and media is made available to students. A resource person is generally located at the center to assist students in the completion of various module learning experiences. Of course, the lack of such a center may pose a problem to many teacher education institutions and some persons may question its practicality. Other potential problems in the instructional support area include, but are not limited to, making provisions for in-service teacher education, recording student mastery of various modules, and resolving conflicts between the academic calendar and variations in student progress.

Costs

A final area of concern is CBTE program cost. Many persons have negative feelings about this important aspect of CBTE implementation, particularly in light of recent budgetary cuts at various colleges and universities across the country. The primary issue associated with costs seems to be one of comparisons between CBTE and traditional programs. Persons inquiring about CBTE generally ask how much more it will cost or how much more they get for their investment. At this point in time it appears many are asking about increased institution budgets *per se* rather than costs in relation to benefits or effectiveness.

IMPLEMENTATION OPTIONS

When the time actually arrives to implement CBTE, there are several options open. The choice may be made to replace a traditional program with one which is completely competency-based. This, of course, would entail an extensive amount of pre-planning and require that numerous resources be on hand for use by teacher educators and students. Each of the five potential constraints to implementation might have considerable impact on this option since it represents the greatest immediate commitment to CBTE. The choice to completely replace a traditional program also has impact on the way a vocational teacher education program is arranged. If a program deals exclusively with part-time in-service teachers from one vocational service area, the replacement approach will certainly create difficulties but would be nothing approaching the difficulties encountered with a program which includes pre- and in-service teacher education for persons in numerous service areas.

A more conservative option to CBTE implementation might be the offering of dual programs, one of which is traditional and the other competency-based. This choice has a distinct advantage in that it should enable students to choose which program best aligns with their needs and learning styles. There are, however, several potential problems with this option. Even though teacher educators may well recognize that the traditional program will eventually be replaced, the cost of operating two separate programs can sometimes be prohibitive. Other possible constraints might include the confusion over faculty roles and the range of instructional support which may be needed.

A third possible option for the teacher educator is to focus initially on implementing one CBTE component of the total program. This choice allows teacher educators and students time to "shake down" the system and identify and eliminate problems before they show up across the entire program. It also enables teacher educators to focus on a more narrow aspect of the program, and thus build high quality CBTE. Taking the component option route could, however, have a damaging affect on commitment. Obligations to make a certain number of program components competency-based each year may soon be overshadowed by other priorities such as maintaining certain enrollment levels or providing graduate level studies. Since it is often found that priorities shift dramatically from year to year, the business of slowly phasing in CBTE may end up being only partially realized.

A PROPOSED FRAMEWORK FOR IMPLEMENTING CBTE

While it is virtually impossible to speak to all the possible teacher education program types, implementation constraints, and implementation options; it is nonetheless important to be aware of what might be associated with a CBTE implementation effort. Figure 1 serves as a graphic representation of these areas. Its purpose is to assist teacher educators in "thinking through" the CBTE implementation process and recognizing that simple decisions and plans are not always possible. It may be noted that three dimensions are represented in the schema which is presented. These constitute the three foci of CBTE implementation: types of programs, potential implementation constraints, and implementation

Figure 1. Factors Associated with CBTE Implementation: A Conceptual Model*

*Representative factors are provided. No attempt has been made to be all inclusive.

options. As data are gathered in support of these dimensions, the teacher educator should begin to see what the best implementation option is for a particular setting. While one may recognize that this sort of decision-making is not the most objective in the world, it is much more so than merely taking the first idea that comes along.

CONCLUSION

This paper does not provide the specific answers to CBTE implementation that many teacher educators would like to hear. Instead, it has presented a framework within which the implementation process may be examined and refined. In fact, each vocational teacher education program is unique. It is closely tied to a specific set of standards, constraints, and operational guidelines; each of which must be accounted for as CBTE is being implemented. The framework which has been presented is designed to address these unique needs. Hopefully, it will enable teacher educators to consider the many factors associated with CBTE implementation and make each new program a stronger one.

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 44P.; PAGES 29 AND 30 CONTAINING CORRESPONDENCE TO CONFERENCE PARTICIPANTS WERE NOT REPRODUCIBLE AND WERE REMOVED. THEY ARE NOT INCLUDED IN THE PAGINATION.

ABSTRACT: THIS REPORT DESCRIBES A TWO-DAY SEMINAR TO ENABLE HOME ECONOMICS TEACHERS TO MORE EFFECTIVELY INTEGRATE HANDICAPPED STUDENTS INTO THE REGULAR CLASSROOM. THE 65 PARTICIPANTS INCLUDED HOME ECONOMICS TEACHERS, UNIVERSITY STUDENTS, SPECIAL NEEDS TEACHERS, AND HOME ECONOMICS SUBJECT MATTER SPECIALISTS IN HIGHER EDUCATION. SEMINAR PRESENTATIONS WERE SUPPLEMENTED WITH PACKETS OF INSTRUCTIONAL MATERIALS AND A BROWSING AREA DISPLAYING AVAILABLE CURRICULUM GUIDES AND RESOURCES. THE PARTICIPANTS COMPLETED TWO ASSESSMENT DEVICES DESIGNED TO MEASURE THEIR DEGREE OF CONTACT WITH PHYSICALLY DISABLED PERSONS AND ATTITUDES TOWARD DISABLED PERSONS. ALTHOUGH RESULTS OF A PRETEST AND POSTTEST SHOWED NO SIGNIFICANT CHANGE IN ATTITUDES TOWARDS THE HANDICAPPED, MANY PARTICIPANTS INDICATED THAT THEIR OVERALL ACCEPTANCE OF AND WILLINGNESS TO WORK WITH HANDICAPPED INDIVIDUALS HAD CHANGED AS A RESULT OF HAVING ATTENDED THE SEMINAR. APPENDED ARE THE LIST OF MATERIALS FOR THE INSTRUCTIONAL PACKET, THE SIX PRESENTATIONS TAPED FOR USE IN FUTURE WORKSHOPS, CORRESPONDENCE, A LIST OF PROJECTS COMPLETED FOR COLLEGE CREDIT, AND RESULTS OF THE SEMINAR EVALUATION. ABSTRACT

A seminar entitled "Adaptation of Home Economics Curricula for Special Needs" was presented February 6-7, 1976 at the University of North Dakota. Sponsorship for the seminar was provided by the North Dakota State Board for Vocational Education and the Department of Home Economics and Nutrition, University of North Dakota. The objectives of the seminar were for the participants to: (1) become more sensitive to the needs of handicapped persons in all aspects of living; (2) describe the ramifications of legislation on education of handicapped children; (3) draw implications for teaching home economics based upon characteristics of the handicapped; (4) describe the interdisciplinary approach of rehabilitation with implications for the home economist's role as a member of the team; (5) become aware of adaptations in facilities and equipment. Seminar topics were selected based upon the objectives. Program faculty represented individuals who had achieved state and/or national recognition within their respective fields. A cross section of professions was represented by the 65 pre and inservice participants. They included: home economics teachers, social workers, special needs teachers, special education teachers, teacher educators, and home economics subject matter specialists in higher education.

I. Foreword

In North Dakota as in other states, legislation has been enacted to insure the right to education by handicapped individuals. As a result, mentally and physically handicapped students are being mainstreamed into regular classrooms.

Successful integration of the handicapped student into regular classrooms is largely dependent upon the attitude and knowledge of the teacher (Abeson, 1974). Since inservice education in adapting home economics curricula for handicapped students was identified as a need by many home economics teachers, a two-day seminar entitled "Adaptation of Home Economics Curricula for Special Needs" was conducted at the University of North Dakota, February 6-7, 1976. This seminar was jointly sponsored by the State Board for Vocational Education and the Department of Home Economics and Nutrition, University of North Dakota.

The primary purpose of the seminar was to enable teachers to more effectively integrate handicapped students into the regular classroom. Specific objectives were for participants to:

(1) become more sensitive to the needs of handicapped persons in all aspects of living;

(2) describe the ramifications of legislation on education of handicapped children;

(3) draw implications for teaching home economics based upon characteristics of the handicapped;

(4) describe the interdisciplinary approach of rehabilitation with implications for the home economist's role as a member of the team;

(5) become aware of adaptations in facilities and equipment.

This paper represents the final report of the seminar.

II. Method, Findings, and Analysis

A. Seminar Program

The program for the seminar was developed in consultation with Dr. Sharon Redick (Iowa State University) who has presented seminars in several states. Further, cooperation was secured from the State Supervisor of Home Economics, State Supervisor of Special Needs, the Medical Center Rehabilitation Hospital, UND Departments of Occupational Therapy and Special Education. Arrangements for the seminar were made through the UND Division of Continuing Education.

Topics were selected based upon the objectives. The program faculty were chosen because of their expertise related to the topic, and because of their recognized positive impact upon audiences. In preliminary interviews, the presenters were encouraged to emphasize within their presentations positive impact upon the audience and practicality for real life situations. The individuals selected had achieved state and/or national recognition within their respective fields.

An outline of the program agenda with the presenting faculty was listed on pages 3 and 4. In the space to the right, the number of the objective which was incorporated into the presentation was noted.

B. Instructional Materials

Many instructional materials were made available to the participants during or as a result of the seminar. These materials were selected based upon the stated objectives. Each participant received an "Instructional Packet" which provided information sheets, articles, and bibliographies to supplement the seminar topics. A listing of articles found within the packet was included in Appendix A.

ORIENTATION TO WORKING WITH HANDICAPPED INDIVIDUALS

7:30 - 8:15	Registration - "Getting to Know You" - Continental Breakfast	
8:30 - 9:00	"Welcome and Orientation" - Glinda Crawford, UND Department of Home Economics and Nutrition	
9:00 - 10:15	"Needs and Characteristics of the Handicapped" Dr. George Lindenfeld, Executive Director, Northeast Region Mental Health & Retardation Center	1 3
10:15 - 11:00	"Experiencing a Handicap" - Mr. Darrell Farland UND Counselor, Student Opportunity Programs	1 3
11:00 - 12:00	"How a Teacher Can Mainstream Handicapped Students" - Dr. Beverly Brekke, UND Center for Teaching and Learning	1
12:00 - 1:00	Lunch	

ADAPTIVE IDEAS AND RESOURCES IN PROGRAM PLANNING

1:00 - 1:45	"Caring and Coping Imaginatively" - Mrs. Jane Winge, Clothing and Textiles Specialist, State Extension Service	1
1:45 - 2:45	"Creating a Living Environment" - Sharon Rask, Chief, Occupational Therapy, Medical Center Rehabilitation Hospital (MCRH)	1 5
3:15 - 5:00	Tour of MCRH Facilities and Orientation to Services - Mary Ann Crawford, Volunteer Services, MCRH	1 [illegible]
7:00 - 9:00	Banquet "Welcome" - Thomas J. Clifford, UND President "Why is Home Economics Important for the Handicapped" - Dr. Sharon Redick, Home Economics Education, Iowa State University	 1 3 4

ADAPTATION OF HOME ECONOMICS CURRICULA FOR THE HANDICAPPED

SATURDAY, FEBRUARY 7, 1976

7:30 - 8:00	Coffee Available	
8:00 - 9:00	"Classroom Adaptation for the Mentally Handicapped" - Dr. Fern Horn, Professor, Home Economics Education, University of Wisconsin (Videotape and conference call)	1 3
9:00 - 10:15	"Adaptation of Home Economics Curricula for the Physically Handicapped" - Dr. Sharon Redick, Home Economics Education, Iowa State University	1 3
10:15 - 10:45	Break	
10:45 - 11:45	"Food Preparation for the Mentally Handicapped" Katherine Staples, Assistant Professor, Nutrition, NDSU	1 3
11:45 - 1:00	Lunch	
1:00 - 1:45	"Legal Rights: Implications for Program Decisions" - Bruce E. Bohlman, Director of Clinical Education, Associate Professor, Law, UND	2
1:45 - 2:30	"Adaptation of Physical Facilities" - Loren Swanson, Vice-President of Operations, UND and Darrell Farland, Counselor, Student Opportunities Program	1 5
2:30 - 4:30	"Teaching Family Life and Sex Education" - Father Lawrence W. Haas, Pastor, Newman Center, UND	1 3
4:30 - 5:00	Conclusive Remarks - Glinda Crawford	

A browsing area was established to display over 100 available curriculum guides, texts, and other resources. The majority of materials were displayed on loan from the personal collection of Dr. Sharon Redick, seminar consultant. Other materials were obtained from various sources including: State Board for Vocational Education, the UND Department of Home Economics and Nutrition, seminar speakers, and the project director.

In order to maintain seminar content for future use, videotapes were made of three sessions while audiotapes were made of three other sessions. These tapes were used (or will be used) in workshops, classes, and independent study sessions across the state after the seminar. A list of the video and audio tapes with notations concerning their use were listed in Appendix B.

At no charge, pamphlets were provided by various agencies which serve the handicapped. These agencies were cited in Appendix C.

C. Participants

1. Direct seminar participation

In total, 65 individuals attended the seminar. Copies of correspondence sent to the participants were included in Appendix D.

A cross section of professions was represented including: vocational and non-vocational home economics teachers, special needs teachers, special education teachers, social workers, teacher educators, home economics subject matter specialists in higher education, and pre-professionals. These individuals represented special settings as well as regular classrooms. Participants also traveled from various parts of North Dakota and eastern Minnesota. This diversity of backgrounds was amenable to a more dynamic and realistic seminar environment.

The seminar was especially designed for North Dakota vocational home economics teachers and related vocational personnel. As such, 25 vocationally employed individuals attended the on-campus seminar including the Assistant State Supervisor of Home Economics, the State Supervisor of Special Needs, 20 vocational home economics teachers, two special needs teachers, and one home economics teacher educator. Breakdown of participation by other groups was: 24 University of North Dakota students, and 16 non-North Dakota vocational educators.

Grant monies were expended to reduce the costs incurred by North Dakota vocational personnel. A reduced fee ($10) was assessed these individuals. This fee (combined with assistance from the grant) covered the costs of food and lodging during the seminar, tuition, and instructional materials. Mileage costs were not included. On the other hand, the fee assessed non-vocational personnel ($25) was established to cover services received (food, tuition, and instructional materials).

2. Indirect seminar participation

Participants were encouraged to share information gained from the seminar. As a result, numerous workshops for teachers and parents were implemented within the state.

The original project proposal specified that if funds were available within the grant at the conclusion of the on-campus seminar, mileage reimbursement could be made to selected North Dakota vocational teachers. These teachers were selected from schools greater than 200 miles from Grand Forks; in addition, they were required to give an off-campus presentation to vocational teachers within their areas of the state.

Money was available for this purpose. Nine teachers were contacted and four teachers expressed interest in presenting workshops. Three Williston teachers presented a workshop to eight teachers, three of whom were vocational. An Ashley teacher prepared and distributed instructional packets to two vocational home economics teachers.

An additional off-campus workshop was planned for the eleven Fargo vocational home economics teachers in August, 1976. Because Fargo was less than 200 miles from Grand Forks, no reimbursement was allotted; however, university credit was achieved by the two teachers planning the project.

In general, these workshops for teachers consisted of participants sharing information and instructional materials from the workshop. In total, 21 teachers will have been contacted through off-campus workshops by August, 1976.

Parents were the target audience for "Family Life and Sex Education" workshops at Hillsboro and Dickinson. Teachers indicated that these sessions provided a positive step toward communication within this area.

D. Credit Option

The seminar was planned to meet University of North Dakota requirements for one semester hour of credit (Home Economics 495.01). Forty-five individuals opted to participate for credit. In order to fulfill the credit obligation, these individuals were required to complete a 20 hour project in addition to the seminar and to participate in a follow-up session. Selection of the project was based upon individual need, interest, and approval of the instructor. Projects carried out by participants were listed in Appendix E.

Follow-up sessions for these individuals were held in Bismarck (April 3, 1976) and Grand Forks (April 5, 1976). For those who could not participate in either session, arrangements were made for telephone conferences or follow-up by correspondence. Sessions included: discussion and comparison of purposes of a home economics program for handicapped individuals versus a home economics program for all individuals; sharing of projects, ideas, and feelings; attitudinal assessment; dissemination of additional seminar instructional materials.

E. Evaluation

Evaluation of the seminar was based upon several factors: participant evaluation of and reaction to the seminar; change in attitude of participants before and after the seminar; and short term follow-up of the participants. Additional follow-up was scheduled for the school year 1976-77.

1. Participant evaluation of and reaction to the seminar

Participants were asked to compute a seminar evaluation form. A copy of the form with the compilation of scores received was shown in Appendix F. Unedited responses to "What Is Your Overall Reaction to the Seminar?" were also listed in Appendix F.

Response to the seminar evaluation form indicated that the majority of the participants were satisfied to very satisfied. Any ratings for a seminar are in part a reflection of the effectiveness of the overall planning process. The high ratings for the speakers may be indicative of the criteria used for selection of these individuals: expertise within the field, positive impact upon audiences and practicality of information presented.

2. Change in attitude of participants

The participants completed two assessment devices: the Degree of Contact with Physically Disabled Persons (Higgs, 1971) and the Attitude Toward Disabled Persons* (Yukor, Block, and Campbell, 1960).

The Degree of Contact scale was composed of 26 statements describing contact to no-contact situations with disabled persons. The items were weighed and scored to indicate: a) virtually no contact with physically handicapped persons (+1), b) contact with physically handicapped persons on a surface level (+2), c) contact with physically handicapped persons which involved personal interaction (+3). Thirty-seven participants responded to the scale; scores of participants ranged from 1.20 to 2.55. The mean score for these participants was 1.95 indicating surface level contact with physically handicapped individuals.

The instrument, "Attitude Toward Disabled Persons", was administered to participants as a pre and post test. This scale was composed of 30 items to which individuals responded on a six-point scale from "strongly agree" (+3) to "strongly disagree" (-3). Thirty-nine individuals completed both the pre and post test. No significant changes were found for either the total score or scores for the individual items.

Several interpretations of the data were suggested. This lack of change in attitudes could in part be attributed to the difficulty for change during a short period of time. Many participants did indicate that although their scores showed little change, their overall acceptance of and willingness to work with handicapped individuals had in fact changed.

*Copyright, Human Resources Incorporated

3. Short term follow-up

In addition to the follow-up procedures identified for the credit participants, the remaining individuals were contacted by mail. The majority of participants clearly indicated through conferences, reporting, and correspondence that the seminar had indeed met the objectives. In particular, these individuals expressed a greater sensitivity to the needs of handicapped persons and an openness to adaptation of their own programs.

This reaction was clearly expressed by a Valley City vocational home economics teacher whose principal objective for her credit project was to adapt a family life class for a blind student:

> "When it comes down to my objective, I feel the adaptation was so natural that it was no adjustment at all. The real adjustment occurred in me - specifically my attitude toward the 'handicapped' student."

F. Budget

The budget was divided into three parts: I. Direct Costs to the Project, II. Income, and III. Indirect Costs to the University. (See budget summary below).

Part I reflected consultant fees, accommodations, audiovisual supplies and services, publicity, educational materials, final project report, and supportive services. Expenditures for accommodations and educational materials represented costs of vocational and non-vocational personnel. It must be noted that specific expenditures of the non-vocational personnel were covered in the conference fee which were listed as project income. (See Part II).

Actual costs for the project ran less than budgeted because the original proposal allocated fee reductions with accommodations for 40 vocational individuals whereas 25 such individuals attended.

Total contribution of the State Board for Vocational Education was $2,890.45, while indirect costs of the University were $1,615.00. Therefore, the total cost of the seminar was $4,505.45.

Part I: Direct Costs to the Project

	Actual Expenditures
1. PERSONNEL	
a. Salaries Only	$ 872.50
b. Employee Benefits	17.25
2. TRAVEL AND SUBSISTENCE:	
a. Subsistence	1,399.26
b. Travel	286.58
3. SUPPLIES AND MATERIALS	
a. Tapes, brochures, labels, three-ring binders	305.79
4. COMMUNICATIONS	
a. Postage	7.31
b. Telephone	1.96

	5. SERVICES		
	a. Duplication, Reproduction, Printing	397.55	
	b. Videotaping	40.00	
	c. Clerical assistance	200.00	
	d. Administrative assistance	400.00	
	e. Supportive service	125.00	
	TOTAL SEMINAR COSTS	$4,053.20	$4,053.20
Part II:	Income		
	1. Conference fees	650.00	
	2. Booklet and student fees	323.75	
	3. Meals	81.00	
	4. Housing	108.00	
	TOTAL INCOME		$1,162.75
	TOTAL EXPENDITURES		$2,890.45
Part III:	Indirect Costs to University		
	Facilities - Lecture Bowl, River Valley Rm, Governors, Nakota, Alumni, Memorial Rms.	200.00	
	Parking Permits @ 2 each	40.00	
	Publicity - Channel 10, KFJM, Univ. News Bureau Releases, Alumni Review Div. of Cont. Ed. Newsletter-Windmill	200.00	
	Mailing Lists - Compiled and Updated	50.00	
	Telephone Usage	100.00	
	Salaries of HEc personnel	1,000.00	
	Univ. Mail Distribution	25.00	
	TOTAL INDIRECT COSTS TO THE UNIVERSITY		$1,615.00

III. Conclusions and Recommendations

The teacher is a key figure in the successful integration of the handicapped student into the regular classroom. Yet many teachers have had little, if any, background for working with the handicapped. Inservice and preservice education within these areas represents an essential step toward facilitating the mainstreaming process.

From responses received from participants, seminars such as this are a step in the right direction toward successful integration.

As a result of this seminar, several specific recommendations were made:

1. Where development of positive attitudes is critical, selection of speakers is inherent in the success of the seminar. These individuals would best be selected based upon their expertise, positive impact upon audiences, and sense of practicality for real life situations.

2. Offering the University credit option has merit for inservice offerings. It encourages greater participation and greater involvement by individuals.

3. Off-campus workshops provide a valuable means for disseminating information within the state. Several procedures could be initiated in order to encourage off-campus workshops. Money could be designated within the project for this purpose in order that a more tangible reward could be offered prior to the seminar. Selection of key teachers is critical for the success of these workshops, this should be done based upon recommendations of the state supervisor as was done in this project.

4. Secretarial time soars for such a project because of the seemingly limitless amount of correspondence, reportings, instructional materials, etc. It is recommended ample secretarial time be allowed.

IV. Acknowledgments

People make a project! Many individuals contributed to the success of the seminar. Dr. Sharon Redick, seminar consultant and Assistant Professor of Home Economics Education at Iowa State University, provided her expertise, her energy, her encouragement and her enthusiasm for the development through the conclusion of this project.

Lois Schneider, former home economics teacher educator at the University of North Dakota, participated in the growth of the project. Lois helped the seminar grow from a spark of an idea to a full glow.

Special assistance was provided from the State Department of Vocational Education, UND Division of Continuing Education, UND Departments of Occupational Therapy and Special Education, and Medical Center Rehabilitation Hospital.

Other individuals who contributed included: the presenters, the participants (from those who traveled many steps to many miles to attend), secretaries, (Karen and Gracie were terrific!), workstudy students, and the Department of Home Economics and Nutrition at UND.

I thank you each and everyone!!

Page 30 containing correspondence to conference participants was not reproducible and was removed from this document prior to its being submitted to the ERIC Document Reproduction Service.

The University of North Dakota

GRAND FORKS 58201

DEPARTMENT OF HOME ECONOMICS AND NUTRITION

TELEPHONE: (701) [redacted]
777-2539

To: Participants in Seminar: "Adaptation of Home Economics Curricula for Special Needs"

From: Glinda Crawford, Teacher Educator, Department of Home Economics and Nutrition, University of North Dakota

I am pleased that you will be participating in the seminar! An excellent program has been designed featuring guest faculty with state and/or national recognition in their respective fields.

This memo will enumerate several items of importance before you arrive:

1. As requested on your registration form, room reservations have/have not been made for the evening(s) of February 5-6.

2. I am enclosing a schedule to let you know what's happening while you are here. We will start and end promptly at the times indicated!

3. I would like to know where you are in relationship to working with the handicapped. Please complete the two instruments attached and leave them at the registration desk when you come to the seminar.

4. If you are taking the seminar for one credit hour, you will need to be aware of guidelines established by the University. I have enclosed a special sheet to explain these to you.

5. In event of inclement weather, call the Department of Home Economics and Nutrition (777-2539), or Division of Continuing Education (777-2661).

6. Lady Bird Johnson will appear with the Winnipeg Symphony Orchestra on the evening of February 5 at 8:15 in the Chester Fritz Auditorium. If you desire tickets, please contact the Chester Fritz Box Office at 777-4211.

7. Free parking is available in the lot indicated on the Directions brochure. Parking permits will be issued at registration.

8. If you have any further questions at any time, please feel free to contact me at 777-2539 or 777-4196. I hope the seminar provides a beneficial experience for you!!!

Encs.

TAKING THE SEMINAR FOR CREDIT

Seminar: Adaptation of Home Economics Curricula for the Handicapped
Course No: HEc. 495.01
Credit: 1 credit hour

Since you are taking the seminar for one credit hour under HEc. 495.01, you need to be aware of two guidelines established by the University:

1. In order to fulfill the mandatory hour requirement, you will need to complete 20 hours in addition to the seminar on related activities. Do something you can get excited about and use! I suggest the following:

   a. 5 hours (approximately) - browse through the packet of materials you will receive at the seminar.
   b. 15 hours - select and complete an activity related to the seminar which is reflective of your own interests and needs, such as:

      1. adapting a lesson (or lessons) for special learners in your classroom,
      2. researching an area of interest,
      3. working with a handicapped person or group in your school or community in a concept area of home economics,
      4. calling a meeting for other home economics teachers in your area to share information you have gained from the seminar.

   At the close of the seminar, you will need to identify your activity and objective. At the completion of the activity, you will submit a one to two page report of the activity you pursued by April 1. Include in your report a summary of what you did, what results were found, and how you felt about it.

2. UND also requires a follow-up group or individual conference with the instructor. Group conferences will be scheduled in early April in Bismarck and Grand Forks. If you cannot attend, a telephone conference with Glinda will suffice.

The University of North Dakota

GRAND FORKS 58201

To: Participants in Seminar:
"Adaptation of Home Economics Curricula for the Handicapped"

From: Glinda Crawford Glinda
Teacher Educator

"Tempis fugit!"

"Spring has sprung" in the north country since we were last together.

As you remember, you completed two evaluation devices prior to the seminar. In order to determine "gain", I'd like to have you complete the "ATDP" once again.

Please complete the attached questionnaire and return the answer sheet to me by May 3. I will return your score by mid-May. (For those who took the seminar for credit, please note this is not being used for grading purposes!)

I have also enclosed a listing of individuals who participated in the seminar. Many of you had indicated you would like to "keep in touch" with a new friend.

Have a good spring!

Thanks!

SPRING IS A TIME FOR PLANTING.

SPRING IS A TIME FOR PLANNING. . . . . .

. . . . . FALL CURRICULUM, EVALUATION, AND INSTRUCTIONAL IMPROVEMENT.

SPRING IS THE TIME TO. . . . .

. . . . . REVIEW IDEAS GLEANED FROM THE UND HANDICAPPED SEMINAR.

. . . . . PLAN FOR ADAPTING YOUR HOME ECONOMICS PROGRAM FOR SPECIAL STUDENTS.

HAVE A PRODUCTIVE SPRING!!!!!!!

Glinda

GLINDA CRAWFORD

APPENDIX E: PROJECTS CONDUCTED BY CREDIT PARTICIPANTS

Planned fall workshop for "Fargo home economics teachers"

Provided learning activities within nutrition for Special Education students

Prepared an illustrated recipe for an educable mentally handicapped person

Prepared materials to aid handicapped persons construct garments

Developed instructional aids for mentally handicapped students in 7th grade classes

Helped girls at Hostel House set up an apartment

Developed and implemented lesson to prepare students for handicapped students entering their classes

Conducted a training workshop for teachers

Shared seminar material with other vocational teachers

Gave demonstration on clothing for physically handicapped persons

Set up food preparation activity for mentally handicapped

Worked with mentally retarded person to help give her ideas on how to prepare food

Introduced 7th grade class to "having a handicap"

Shared information with faculty

Planned fall workshop for home economics teachers

Developed illustrated task sheets to enable an educable mentally retarded student to perform a household task, serving technique, and recipe

Provided learning activities for slow learners in regular class

Instructed a hearing impaired individual on Food Preparation, embroidery, dance step

Prepared food activities for trainable mentally retarded children

Adapted family living curriculum for blind student

Taught lesson on sex education to residents of Grafton State School

Developed independent study packet for slow learners (will field test next year)

Identified characteristics of the EMH student

Adapted a lesson on "Your Paycheck"

Developed picture recipes for slow learner

Presented program on "Sex Educatio.." to parents of Association of Retarded Citizens

Examined materials and adapted for slow learners in 7th and 8th grade classes

Provided learning experiences for physically handicapped student in Foods I

Developed visual aids for slow learners on basic clothing skills

Acquainted regular students with handicapped students

Brailled out textiles instructional package

Developed a learning center on the Basic Four to mainstream mentally handicapped

Taught unit on kitchen appliances and equipment to residents at Grafton State School

Wrote information for handicapped person - visual, and individualized instruction

Prepared bibliography on family life and sex education

Conducted a training session workshop

Investigated parental role in family of handicapped child

Prepared lesson plans for handicapped for clothing, housing and family relations

Developed and tested picture recipes

Prepared lessons for slow learners in student teaching class

Designed recipes for trainable or educable mentally retarded

Taught basic skills of home economics to blind students

Worked with mentally retarded on sex education

Conducted a training session for teachers workshop

APPENDIX F: SEMINAR EVALUATION FORM AND RESPONSES

Seminar Evaluation: Adaptation of Home Economics Curricula for the Handicapped
February 6-7, 1976

Name _____

Did you register for credit? _____

Occupation (check): ___North Dakota Vocational Home Economics Teacher
___Other (indicate): _____

Please give your reaction to the following items by (1) rating each according to the scale indicated and by (2) commenting briefly about why you felt as you did.

Item	Reaction (check) Disappointed	Satisfied	Very Satisfied	Comments
1. Choice of Topics		12	47	
2. Pre-workshop publicity received	1	30	25	
3. Scheduling at this time of year	1	27	29	
4. Availability of credit	2	19	34	
5. Program faculty		13	46	
6. Overall schedule of activities		33	35	
7. Amount of time available to cover material	3	30	25	
8. Method(s) of presentation	5	22	31	
9. Seminar Topics: a. Needs and Characteristics of Handicapped	4	15	37	

Seminar Evaluation - page 2

Item	Reaction (check) Disappointed	Satisfied	Very Satisfied	Comments
9. b. Experiencing a Handicap		11	48	
c. Mainstreaming	25	27	7	
d. Caring and Coping Imaginatively ...	14	26	19	
e. Creating a Living Environment		23	33	
f. Tour and Orientation of MCRH	4	5	30	
g. Why Home Economics for the Handicapped?		8	48	
h. Adaptation of Home Economics Curricula for the Physically Handicapped		15	42	
i. Classroom Adaptation for the Mentally Handicapped	1	31	27	
j. Food Preparation for the Mentally Handicapped	2	19	38	
k. Legal Rights - Implications for Program Decisions	5	29	23	
l. Adaptation of Physical Facilities		16	38	
m. Teaching Family Life and Sex Education	2	5	43	

Item	Reaction (check) Disappointed	Satisfied	Very Satisfied	Comments
10. Seminar Instructional Packet		13	44

b. Living Arrangements	1	6	20	
c. Facilities for Presentations		18	37	
d. Geographic Location	1	23	34	

What is your overall reaction to the seminar?

For vocational home economics teachers:

Would you be interested in future inservice seminars from UND?

Yes No (Circle) If yes, in what areas?

Which time of year do you prefer? (Circle)

Summer Fall Winter Spring No preference

Seminar Evaluation - page 4

For those who take the seminar for credit:

Which follow-up session do you anticipate that you would be able to attend?

(Circle)

Friday, April 2
(Bismarck)
State FHA Meeting

Monday, April 5
(Grand Forks)
7:30-8:30 pm

Neither
Telephone Conference
is Preferred

WHAT IS YOUR OVERALL REACTION TO THE SEMINAR?

- I felt it presented valuable ideas, instructional experiences, and materials. It fulfilled a great need for home economics teachers.

- Great - good information to take back to the classroom. Well-planned. (V)

- Excellent. Thank you for the opportunity. Glad you didn't limit it to Home Ec teachers.

- Very good! Some people - most people cannot comprehend any more after 50-60 minutes of straight factual lecture - shorten the lecture time. (V)

- I enjoyed it very much and feel I gained alot of useable future knowledge.

- Excellent - would have enjoyed more emphasis on working with mentally handicapped. (V)

- Very informative and much needed with mainstreaming in my school

- Inspiring, motivating, stimulating. Learned a lot!! More than that, I'm ready to put some things to work. You are to be commended for the hard work that goes into planning a seminar of this nature. You have a beautiful campus here at UND. Would it be possible for UND and NDSU to work together in the future on such seminars?

- pretty good reaction overall.

- I learned a few things. I wish we could have done more sharing under the direction of the various speakers, like we did right after the first one, picking out important points and discussing and commenting as groups. (V)

- I thought it was a worthwhile experience and it answered alot of my questions. It gave me information I could use if I need to find any information for something I may encounter later.

- Was of a definite interest to me in my field of work. I think more special ed students should have heard about it.

- Very pleased. Glad I came.

- The more I learn - the more I find there is to learn. Overall, I felt that the seminar was extremely well-organized and very professional.

- Excellent for stimulating interest. Very full two days, but everyone seems to feel the time has been well-spent. (V)

- Was worthwhile (V)

- An excellent seminar. I am so glad to see UND get actively involved. I'm a graduate of UND Home Economics program and am very proud to be, particularly when they show such competency and involvement. (V)

- Excellent - best seminar I have attended. (V)

- When I began this seminar, I had no background with the handicapped. Now I realize just how much I don't know but at least I am getting some ideas on how to work with them. I can also apply this to slow students! I am really fired up and can't wait to apply some of this! (V)

OVERALL REACTION - page 2

- Personally, I feel a great need for this education. - (V)

- I have never been more pleased with an activity of this type. We could get into the subject without the pressure of feelings of a regular class. Most important for me was to see, hear and visit with home economics professionals who have done fantastic things and are successful. They have made it much clearer what needs to be done and that we are the people who can do it. It is clear that an awful lot of work was done to make this seminar just super worthwhile!!

- Very good. (V)

- Very good for me - both in teaching and as a person.

- Excellent - very beneficial

- I found it to be very worthwhile - most of the speakers were interesting and I can use many of the ideas and materials that were presented. (V)

- very beneficial to my teaching. I wish I had this help before I taught blind students and mentally handicapped students. (V)

- Excellent - covered many phases in a concentrated period which I like. Really brought across the point of teacher importance and rather frustrated me with the amount of time it will take. I was interested in "buddy" system etc. as helps.

- I thought it was a very productive and needed workshop. I, being a male, can't identify with all of the topics covered but I found it interesting and informative.

- Very, very good. It brought up many new ideas and made me reexamine my own personal ideas, views and prejudices.

- I was very impressed with all the planning that was necessary to make this seminar a success. It has been very informative and I am looking forward to another seminar of this kind.

- I want to get out and actively try it. But I'm unsure of planning, which I'm sure will come with experience.

- Excellent, great opportunity, enthusiastic people 'sold' their enthusiasm on disabled. Would love to come to another such seminar. We had very long days but I realize we needed hours for credit. We're not used to sitting all day. (V)

- I feelI really learned a lot from this seminar. I can use some of it in my classroom and this will help to write our grant for our school. Very interesting and good speakers.

- I felt the students were belittled to a point. I also feel that it should have been left up to the individual if he or she wanted to go to the Rehab (some students may have wanted to go and a student's time is just as valuable as others). (V)

- positive - worthwhile experience (V) - Educator

- Excellent. But would like to have had time to discuss with other teachers after each session. It may have been too time structured.

- Very good

OVERALL REACTION - page 3

- The seminar was very interesting, but much more concerned with the physically handicapped (which I don't have any) than the mentally handicapped. It was a real education for me. (V)

- Very intensive. Good. Would have liked copies of some of the speakers' speeches.

- My overall opinion of the seminar was excellent. The speakers were more than anyone could have hoped for. The material is also very handy and should be used often. I am very disappointed that I, as a "student", was treated so differently from the other participants of the seminar. (ex: name tags, field trips, etc.) I felt that I was handicapped. But again, this did not take away from the sharing, and caring people who care to give at this seminar!

- Goosebumps! Very informative plus lovely people caring about others - handicapped or not! Another step towards education that has not had much previous coverage.

- This was my first workshop and I can honestly say I really grew from it and enjoyed it very much. I learned about so many different aspects of the handicapped. I felt overall it was well-presented and interesting. I now look forward very much to other workshops of any kind pertaining to home ec. and education - really a worthwhile two days - hope there will soon be more offered on various topics for us to learn more! I also feel a seminar like this one at this time of year is good because it is not too busy and it is nice to break up the long winter with something stimulating!

- Very interesting - very applicable but more distinction between physical handicaps and mental retardation in suggestions - then discuss the combination. Dr. Redick's presentation on Sat. was very helpful in separating, making distinctions, yet tying together. "Handicapped" is too broad.

- Despite far too little sleep, (we talk too much shop with 4 in a room!) I can't resist telling you this was the most informative workshop I have attended in 10 years. Many thanks for your great efforts in putting all of this together. (V)

- Timely topic as a whole. I am glad I could come. I felt the order of topics gave great continuity. Very worthwhile - time well spent. Such interesting variety of techniques used in presentations! Even though my special interest was not covered too much, there were so many ideas I can use in my classroom. One always needs some stimulation.

- I feel benefited from it.

- I have learned so much and it is so exciting to be caught up in a "professional" meeting. This seminar was a worthwhile experience for me and has left me with a lot of new learnings and ideas.

- The seminar topics and lectures gave me a positive reaction. It created a feeling of wanting to find out more about working with handicapped because home ec. has so much to offer. However, since time was set aside 2 days from student's schedules, I think some arrangements should have been made for students to also tour the MCRH.

- Overall seminar was great.

- When I registered for the seminar, being a practical person, I was worried that I wouldn't be getting my money's worth, but I was very pleased with the speakers and the material presented and have received more than my money's worth.

OVERALL REACTION - page 4

- Overall it was great.

- Wonderful organization - good keynote speaker topped off by an excellent final speaker. This was one of the best seminars I have ever attended and hope that in the future there will be more - the number attending was about right to make it interesting but not overwhelming. (V)

- Well-planned - I like things to run on time. Presentations for the most part were very interesting. (V)

- Very good and necessary, I feel it was worthwhile.

- I enjoyed it very much and feel I have learned much about the characteristics of the handicapped and how to better aid them in the classroom. (V)

- I expected more examples of what exactly can be done - it was satisfactory overall. Some speakers were excellent.

- I feel the seminar has been very worthwhile and very educational. I feel the information we have been given will be very useable in my future teaching and interaction with handicapped. (V)

- I was somewhat disappointed with the first day's presentations. The presentations on Saturday were very good. This seminar has really made me aware of the problems faced by the handicapped and has made me better prepared to deal with them.

TITLE: HOME ECONOMICS RELATED OCCUPATIONS PROMOTION IN NEBRASKA THROUGH MEDIA, VISITATIONS, AND PROFESSIONAL DEVELOPMENT. FINAL REPORT.

DESCRIPTOR: *HOME ECONOMICS TEACHERS; METHODS COURSES; INSERVICE TEACHER EDUCATION; *WORK EXPERIENCE PROGRAMS; PUBLIC RELATIONS; PROGRAM DEVELOPMENT; STATE PROGRAMS; *OCCUPATIONAL HOME ECONOMICS; SECONDARY EDUCATION; POSTSECONDARY EDUCATION; *PUBLICIZE; *INFORMATION DISSEMINATION; RESOURCE MATERIALS

IDENTIFIER: NEBRASKA

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 49P.; APPENDIX E CONTAINING CORRESPONDENCE TO WORKSHOP PARTICIPANTS WAS NOT REPRODUCIBLE AND WAS REMOVED. IT IS NOT INCLUDED IN THE PAGINATION.

ABSTRACT: THE ONE-YEAR STUDY WAS PRIMARILY A PUBLIC RELATIONS THRUST TO FAMILIARIZE NEBRASKA HOME ECONOMICS TEACHERS AND THEIR ADMINISTRATORS WITH THE BENEFITS OF IMPLEMENTING HOME ECONOMICS RELATED OCCUPATIONS (HERO) PROGRAMS INTO THEIR CURRICULUM. PROCEDURES WERE TO: (1) DEVELOP PROGRAM EVALUATION REVIEW TECHNIQUES (PERT); (2) USE MASS MEDIA, SUCH AS BROCHURES, NEWSPAPER ARTICLES, AND SLIDES; (3) PROVIDE INSERVICE EDUCATION THROUGH VISITS TO INTERESTED TEACHERS AND ADMINISTRATORS; (4) PREPARE A BIBLIOGRAPHY OF CURRENT MATERIALS AND RESOURCES; (5) TEACH THREE HERO WORKSHOPS; (6) DEVELOP GUIDELINES TO AID IN INITIATING AND ADMINISTERING HERO PROGRAMS; AND (7) EVALUATE RESULTS AND CONDUCT FOLLOWUP ACTIVITIES. THE ANTICIPATED 100 PERCENT INCREASE IN THE NUMBER OF HERO PROGRAMS WAS ACHIEVED AS A RESULT OF THE PROJECT. IT WAS RECOMMENDED THAT CONTINUED ASSISTANCE BE PROVIDED IN IMPLEMENTING PROGRAMS THROUGH METHODS COURSES, WORKSHOPS, DISSEMINATION OF RESOURCE MATERIALS, AND SERVICES OF A FULLTIME CONSULTANT. APPENDED ARE PROJECT CORRESPONDENCE, THE COURSE SCHEDULE, AND SCRIPT FOR THE SLIDE PRESENTATION. (AUTHOR/RG)

SECTION I

HOME ECONOMICS RELATED OCCUPATIONS PROMOTION IN NEBRASKA THROUGH MEDIA, VISITATIONS, AND PROFESSIONAL DEVELOPMENT

FINAL REPORT

ABSTRACT

Title of Project:	Home Economics Related Occupations Promotion in Nebraska through Media, Visitations, and Professional Development
Project Director:	Dorothy Sue Harvey
Applicant Organization:	Kearney State College
Duration of Project:	1 July 1975 - 30 June 1976
Total Federal Funds Requested:	$15,999.91

STATEMENT OF PROBLEM:

The Vocational Act of 1963, and the Amendment of 1968 were to assist, maintain, extend and improve existing programs and to develop new programs so people could have access to train and retrain for opportunities for gainful employment. Gainful employment programs in vocational homemaking education are those which prepare students for employment in occupations requiring knowledge and skills in one or more of the home economics subject areas. Despite this legislation, Home Economics Related Occupations Programs (HERO) are not fluent in Nebraska. At present a study is being done in Nebraska with Home Economics Related Occupations which consist of public relations thrust to familiarize Nebraska home economics teachers and their administrators with the benefits of implementing HERO programs into their home economics curriculum.

Due to lack of time many of the interested home economics instructors and administrators were not contacted to be informed of the HERO program. Therefore, the problem is:

(a) To visit Nebraska secondary home economics teachers and administrators who have indicated an interest in developing Home Economics Related Occupations programs.

(b) To develop and utilize exisiting materials for dissemination to Nebraska secondary home economics teachers to aid them in initiating and administering HERO programs.

(c) To conduct a public relations thrust in order to familiarize or acquaint Nebraska home economics teachers and their adminstrators with the benefits of implementing HERO programs into the home economics curriculum.

(d) To enhance the development of such programs by providing opportunities for in-depth HERO preparation.

Purposes or Objectives:

(a) To visit Nebraska secondary home economics teachers and administrator who have indicated an interest in developing HERO programs.

(b) To develop and utilize existing materials for dissemination to home economics teachers in order to aid them in initiating and administering HERO programs.

(c) To facilitate a public relations thrust which would include publications, use of mass media and personal visitations to target populations.

(d) To provide in-service instruction in curriculum development and course organization for secondary home economics instructors.

Procedures:

(a) To visit selected home economics teachers and their administrators throughout the state of Nebraska.

(b) To conduct a public relations thrust which consists of informative brochures, newsletters of HERO happenings, radio and newspaper articles, use of a slide series.

(c) To teach three HERO workshops during the 75-76 fiscal year.

Contribution to Vocational Education: The results of this study will be to:

Familiarize Nebraska secondary and community college home economics teachers and their administrators with HERO programs and FHA-HERO as an integral part of the HERO program.

Evaluation Procedure:

(a) Quarterly progress reports to the State Department of Education, Vocational Division.

(b) A PERT will be developed and utilized to insure that the objective of this project will be accomplished.

SECTION II A

Objectives:

1. To conduct a public relations thrust which would include publications and use of mass media to all concerned individuals.

2. To provide in-service education through personal visits to selected home economics teachers and their administrators throughout the state of Nebraska in order to acquaint them with the benefits of implementing a HERO program in home conomics.

3. To provide in-service instruction in curriculum development and course organization for secondary home economics instructors.

The home economics teachers and administrators will:

(a) establish local needs for a HERO course in their particular community and relate these findings to the employment opportunities statistics from the Research Coordinating Unit.

(b) develop plans for coordinating on-the-job community work experience.

(c) identify teaching aids and resources for various HERO programs.

(d) develop methods and techniques for evaluating HERO programs.

(e) develop plans for organizing advisory committees.

(f) identify HERO programs that could be adopted to individuals with special needs.

(g) revise or develop curriculum for a unique or specific HERO program.

(h) develop plans for organizing HERO youth organizations.

4. To develop and utilize existing materials for dissemination to home economics teachers to aid them in initiating and administering HERO programs.

Procedures:

A. General Design

1. Initiate a public relations thrust which would consist of informative brochures, newsletters of HERO happenings, radio and newspaper articles and use of a slide series on HERO in Nebraska.
2. Provide in-service education through visits to selected home economics teachers and their administrators throughout the state of Nebraska to acquaint them with the benefits of implementing HERO programs in the home economics curriculum.
3. Review current materials and resources relating to HERO and update a bibliography of available materials which will be made accessible to secondary home economics instructors with an interest in HERO.
4. Develop a HERO program outline for workshops for the 1975-76 fiscal year.
5. Teach three HERO workshops during the 1975-76 fiscal year.
6. Development of guidelines to aid secondary home economics teachers in initiating and administering HERO programs.
7. Evaluate by determining the increase of HERO programs within the state of Nebraska as a result of the project.
8. Follow-up study of participants to determine (a) strengths and weaknesses of HERO workshops (b) problem areas not covered in HERO workshops and (c) number of HERO programs being developed and/or implemented at secondary and post-secondary level.

B. Location

Kearney State College is centrally located in the state and has the needed space and facilities for this project. Moreover, the Nebraska curriculum laboratory is located on the KSC campus and will be utilized extensively because of its collection of HERO curriculum guides and resources.

C. Population

The target population will be the secondary and community college home economics teachers in the state and their immediate program administrators who have indicated an interest in the HERO program.

D. Methodology

In order to familiarize or acquaint Nebraska home economics teachers and administrators with the benefits of implementing HERO programs into their home economics curriculum, visitations will be made to those teachers and administrators who have indicated an interest in the HERO program.

A public relations thrust will be conducted through the use of informative brochures, newsletters of HERO happenings, radio and newspaper articles, and use of a HERO slide series.

Guidelines to aid secondary home economics teachers in initiating and administering HERO programs, will be developed and disseminated to home economics teachers who have indicated an interest during their visitation.

The results of HERO visitations made to home economics teachers and administrators in the state of Nebraska will be sent to the State Director of Home Economics for further follow-up.

Current materials and resources relating to HERO will be constantly reviewed and a bibliography of available materials will be updated and made available for dissemination.

Workshops will be developed to meet the needs of interested home economics teachers to aid them in the development of a HERO program. The workshop course content will be printed and distributed to all concerned educational institutions in the state.

These workshops would lend themselves to off-campus instruction and it is expected that it could be offered in various parts of the state, depending on demand and request.

E. Time Schedule

First Quarter	Develop PERT Gather Materials Develop workshop course content Initiate a public relations thrust Personal visitations to target population
Second Quarter	Personal visitations Implement HERO workshops Continue public relations thrust throughout the remaining quarters
Third Quarter	Personal visitations Implement HERO workshops
Fourth Quarter	Personal visitations HERO workshops Evaluate results of program follow-up Disseminate results of project

F. Evaluation

Evaluation will be determined by the number of HERO programs that are developed as a result of the project. It is expected that a 100% increase in HERO programs in the state of Nebraska will occur.

A PERT will be developed and utilized to insure that the objectives of this project will be accomplished. The PERT will be based on these principal activities:

Determine administrative setup.

Develop and utilize publications for public relations thrust.

Mail to target population.

Develop monthly plan for visitations.

Develop guidelines for secondary home economics teachers use in initiating HERO programs.

Mail to interested teachers previously contacted through HERO visitations.

Review current curriculum materials and resources relating to HERO and update the bibliography.

Develop HERO workshop course content.

Teach three HERO workshops during the 1975-76 fiscal year.

Evaluate results and make necessary changes in HERO workshops.

Evaluate project by determining the increase of HERO programs within the state of Nebraska.

Disseminate results of project follow-up study.

G. Coordination

The results of this study will be made available to the State Department of Education and all appropriate state educational institutions including secondary schools, community college and four-year colleges and universities.

STAFF PARTICIPANTS

The Project staff is listed below:

Dorothy Sue Harvey, Director
25% time on project

Marcene Blue Gillham, Assistant Project Director
60% time on project

Murleen Felzien, Secretarial
15% (20 hours per week for school year)

SECTION II B

IMPLEMENTATION OF STUDY

The Project began with an orientation of the project staff to the objectives and procedures indicated in the exemplary proposal. A project PERT (Program Evaluation Review Techniques) was developed to insure that the objectives of the project were met and the PERT was also developed and instituted in order to present an overview of sequential events, establish priorities, and designate responsibilities.

PROGRAM EVALUATION REVIEW TECHNIQUES

September

Determine administrative staff

Obtain needed facilities, supplies and equipment

Orient staff

Develop PERT

Determine date of course offering

Review current curriculum materials and resources

Re-establish communication with interested teachers and administrators

Begin public relations thrust

October

Develop schedule of visitations to teachers and administrators interested in HERO

Develop HERO course content

Visitations to home economics teachers and administrators that have indicated an interest in initiating a HERO program.

November

Correspond with individuals visited to keep them informed of up-to-date materials and new developments in HERO

Continue school visitations

Develop materials for use in workshop

Develop tentative schedule for HERO course

December

Disseminate information regarding HERO course to all home economics teachers in area

Order resources and contact resource persons for HERO course

Continue school visitations and correspondence

Review new curriculum materials and resources

Contact consultant to further develop public relations thrust

January

Begin teaching three semester hours credit HERO course

Continue public relations thrust

Continue school visitations and correspondence

Develop and revise materials for use in workshop

Advice consultant regarding content and format of public relations thrust

February, March, April

Teach three semester hours credit HERO course

Continue school visitations and correspondence

Revise bibliography of HERO resources for use by teachers and administrators

May, June

Teach three semester hours credit HERO course

Evaluation of course -- the staff will develop and have ready for use an evaluation device that will be designed to get at attitudes, confidences, and knowledge scale.

The major activities and accomplishments that were achieved according to the PERT (Program Evaluation Review Techniques) are listed and discussed according to reporting periods in the following paragraphs.

MAJOR ACTIVITIES AND ACCOMPLISHMENTS

FOR SEPTEMBER, OCTOBER, NOVEMBER, DECEMBER

Orientation

(a) The project staff gained knowledge of HERO programs and how they function in Nebraska through study of articles, books, curriculum materials, and resources relating to occupational home economics.

Communication Re-established

(b) Communication was re-established with interested teachers and administrators who were visited concerning HERO during 1974-75.

Visitations

(c) Visitations were made to home economics teachers and administrators that have indicated an interest in initiating a HERO program (Appendix A). The project staff continually corresponded with the individuals visited. This reinforced the personal contact and informed them of new HERO curriculum materials and resources.

Student Recruitment

(d) Information was disseminated to all home economics teachers in the area regarding the HERO course that was scheduled to be taught spring semester. (Appendix B)

Spring Course Schedule

(e) A tentative schedule was made for the HERO course scheduled to be taught spring semester. (Appendix C)

MAJOR ACTIVITIES AND ACCOMPLISHMENTS

FOR JANUARY, FEBRUARY, MARCH AND APRIL

HERO Course Taught

(a) The project staff taught the HERO course in the team teaching method according to the schedule planned.

HERO Workshop

(b) Content and materials were developed for the HERO course and workshop. A HERO course was taught on campus during the spring semester 1976.

Slide Series Development

(c) The project staff worked with a consultant to develop a slide series with script narration on tape entitled "Occupational Home Economics in Nebraska."

Student Recruitment

(d) Activities included recruitment of students through visitations, letters and telephone calls.

Resource Materials Reviewed

(e) Resource materials for occupational home economics were reviewed for use and purchase.

HERO Presentation at NHEA Meeting

(f) To continue the public relations thrust to the college population a presentation of the slide series developed of Occupational Home Economics in Nebraska was given to the Vocational Student Member Section of NHEA in the Kearney State College Home Economics Department.

School Visitations

(g) Visitations to schools were continued. (Appendix A)

MAJOR ACTIVITIES AND ACCOMPLISHMENTS

FOR MAY AND JUNE

HERO Course

(a) The project staff completed teaching the HERO course on campus as scheduled for the spring semester.

HERO Workshop

(b) Content and materials were developed for the summer off campus workshop. (Appendix D) The off campus workshop was taught at the Mid-Plains Community College which was a central location for the students attending the workshop June 14-25, 1976.

Slide Series Completed

(c) The project staff worked with a consultant to complete a slide series with script narration on tape entitled "Occupational Home Economics in Nebraska."

Student Recruitment

(d) Activities that involved recruitment of students for HERO workshop included: (Appendix E)

1. Slide presentation and visitation of teachers at North Platte.
2. Visit was followed by a personal letter of information about the workshop to the teachers at North Platte.
3. Another letter of information and invitation concerning the HERO workshop at North Platte was sent to Home Economics teachers that indicated interest on a survey taken previously through the HERO project and from visitations.

Resource Materials Selected

(e) Resource materials for Occupational Home Economics were reviewed for use and purchase. (Appendix F)

HERO Presentation at State FHA Meeting

(f) A presentation of the slide series developed of Occupational Home Economics courses taught in Nebraska was given along with a display of information to those attending the State FHA Conference in Lincoln, April 5, 1976.

Bibliography Revised

(g) Revision of the bibliography of Occupational Home Economics resources was completed. Copies were made available for teachers who plan to develop Occupational Home Economics into their curriculum.

Off Campus HERO Workshop

(h) A three semester hours credit Occupational Home Economics workshop was conducted at North Platte, June 14-25, 1976.

Publicity on Slide Series

(i) Letters were written to Home Economists across the state to inform them about the slide presentation being available for their use. (Appendix G)

HERO Slide Series Duplicated and Distributed

(j) Duplicates of the slide series were placed in the State Home Economics Director's office in Lincoln, and one in the Home Economics Department at Chadron State College. The original of the presentation is available through the Nebraska Vocational Curriculum Resource Center in Kearney. The slide series was placed in the eastern, central and western areas of the state for accessibility by those who would want to use it. It was evident to the staff that the slide series would be used to promote Occupational Home Economics more frequently through location and availability. Pamphlets developed during the

BEST COPY AVAILABLE

project to inform the public about Occupational Home Economics are placed with each of the slide series. (Appendix H)

Display for August Teachers Conference

(k) A display of Occupational Home Economics resource materials was designed to be used at the State Vocational Teachers Conference in Kearney, August 16-18, 1976. The resource materials are those purchased with HERO Project funds. The materials are available on free loan to teachers through the Nebraska Vocational Curriculum Resource Center where they have been catalogued. The display will include lists of prices and addresses for ordering materials, some examples of the materials in the curriculum center and the slide series and pamphlets explaining the Occupational Home Economics Program.

Resource List Completed

(a) A resource list was completed and made available through duplication for persons interested in developing an occupational program. The resource list includes names, addresses, and cost of those materials placed in the Nebraska Vocational Curriculum Resource Center. Careful review was made by the HERO Project staff of the resource materials selected. By reviewing the resources mentioned, it is believed that the teacher would be prepared to select and purchase materials for an Occupational Program. Another use would be to supplement resources available in the Home Economics Department. Copies of the list will be placed in the State Home Economics Director's office and will be available to those who indicate an interest in the occupational materials.

CONSULTANTS

The following people worked with the HERO staff in consultative capacities:

Linda Redmon	Free Lance Home Economist
Dorothy Farr	Occupational Home Economics Instructor Grand Island, Nebraska

RESOURCE PERSONS

The following people work with the HERO staff as resource persons during the class experience:

Jay Lees	Job Service of Nebraska Grand Island, Nebraska
Dave Bodle	McKnight Publishing Company Bloomington, Illinois
Marilyn Kappler	Restaurant Manager Holiday Inn Kearney, Nebraska
Tom Gay	Day Care Supervisor Kearney, Nebraska
Artie Hobbs	Head Start Director Kearney, Nebraska
Elsie Cafferty	Special Vocational Needs Kearney State College Kearney, Nebraska
Bob Schrimpf	Job Service of Nebraska North Platte, Nebraska
Sister Joan	Day Care Center North Platte, Nebraska
Mr. D. Burnett	Burger Chef Manager North Platte, Nebraska
Mr. Hirschfeld	Hirschfeld Clothing Store Manager North Platte, Nebraska

SECTION II D

MAJOR MEETINGS ATTENDED

October 16-18, 1975	State Home Economics Teacher Educator's Retreat Waverly, Nebraska
October 28-31, 1975	National Vocational Educator's Conference Omaha, Nebraska
December 4-11, 1975	American Vocational Association Anaheim, California
March 15, 1976	State Home Economics Teacher Educator's Meeting Lincoln, Nebraska
April 5, 1976	State Future Homemakers of America Meeting Lincoln, Nebraska
August 16-18, 1976	State Vocational Teachers Conference Kearney, Nebraska

BEST COPY AVAILABLE

SECTION III

RESULTS AND CONCLUSIONS

Evaluation Data Collected:

The project staff regularly appraised the progress of the project in terms of planned objectives and the sequence of activities depicted on the PERT chart.

An evaluation device designed by the HERO staff previously was used to inform the HERO teaching staff the scale of attitudes, confidences and knowledge of students in the HERO course.

Quarterly Evaluation Reports:

Sue Harvey, HERO Project Director, submitted a written evaluation report each quarter to Mr. Merle Rudebusch, Division of Vocational Education, State Department of Nebraska. The quarterly reports include staff utilization, major activities, and accomplishments, activities and events planned for the next reporting period, dissemination activities and budget request forms.

External Evaluation:

It was expected that a 100% increase in HERO programs in the state of Nebraska occur. This evaluation will be done as schools send applications to the State Department to initiate HERO programs into their school system. An unofficial estimation indicates a 100% increase in the number of HERO programs in the state of Nebraska as a result of the project. Those programs established through assistance of the project staff are successful ones. Further indication of results will be observed as schools who are in the preliminary stages of establishing programs are successfully established. Many of the school administrators and Home Economics Teachers contacted support the philosophy of the occupational programs and are

examining their own school for an occupational program and want to learn more about the program.

Impact Upon Vocational Education:

The results of this study made a contribution to Vocational Education in that it began the process of familiarizing Nebraska secondary and community college home economics teachers and administrators with the importance of Occupational Home Economics. Through the exemplary project the staff was able to assist teachers with newly established programs, make materials and resources available for teachers to use as other Occupational Home Economics programs are established, develop additional public relations information to encourage program development and Occupational Home Economics in Nebraska, and teach a course that would train teachers in methods of establishing and teaching an Occupational Home Economics class in a public secondary school.

SECTION IV

RECOMMENDATIONS AND SUGGESTIONS

The HERO staff makes the following recommendations to further develop Occupational Home Economics in Nebraska:

(1) The HERO course should continue to be taught as a methods course to the Vocational Home Economics Education students at Kearney State College.

(2) The HERO course should be taught off campus as a workshop for small groups of Home Economics teachers.

(3) Resource materials for Occupational Home Economics should continue to be reviewed and updated, and continue disseminating curriculum lists to Nebraska Home Economics teachers.

(4) Consultant person on a full-time basis be made available to travel to the site of a future Occupational Home Economics program on the secondary level to assist the implementation procedure. The consultant should also be available to existing programs for assistance.

From: Marcene Gillham; Sue Harvey, HERO Project, Kearney State College

Re: 3-credit HERO course, Spring 1976

A three credit course, Vocational Education 441/541, "Teaching Home Economics Related Occupations," will be held each Tuesday at 6:30 P.M. during second semester at Kearney State College, West Campus, Room 229.

This course is designed to help the secondary home economics instructor organize and implement a successful occupational home economics program.

During the course you will begin to develop Occupational Home Economics for your local school. Resources will be available for your review. The sessions will be highlighted by a number of resource persons. In addition, you will have the opportunity to observe actual work situations to help you determine skills needed for entry level jobs.

The course is available for undergraduate or graduate credit. Registration will take place at the first session, Tuesday, January 6, 1976. The course will be completed by May 4, 1976.

The course will be conducted by Sue Harvey, HERO Project Director and Instructor in Home Economics Education, and Marcene Gillham, HERO Project, Kearney State College.

May 19, 1976

I would like to inform you about a slide presentation entitled "Occupational Home Economics in Nebraska" being made available for your use.

The past two years a federally funded project has had as its goal to inform the public in our state about the Occupational Home Economics program. A slide and tape presentation has been produced that describes Occupational Home Economics in action as seen at several schools in Nebraska. The presentation is telling the story of successful programs and outlining what composes an Occupational Home Economics Program.

Because we are interested in the further development of Home Economics in Nebraska the slide series will be available in the geographical area closest to you. I sincerely hope that you will plan to use the presentation during the coming year as an educationally informing and updating experience in Home Economics.

After June 30 the presentation will be available on free loan from the following resources:

Nebraska Vocational Curriculum Resource Center
West Campus
Kearney State College
Kearney, NE 68847

Home Economics Department
Chadron State College
Chadron, NE

Marge Harouff
State Department of Education
Division of Vocational Education
233 South 10th Street
Lincoln, NE 68509

If I can be of any further assistance to you, please write or call and I will be glad to help you get further acquainted with Occupational Home Economics.

Sincerely,

Sue Harvey

APPENDIX H

SCRIPT - OCCUPATIONAL HOME ECONOMICS IN NEBRASKA

1. WHAT SHALL I DO? AM I WORTH ANYTHING TO MYSELF OR ANYONE ELSE? WHERE IS MY LIFE GOING?

2. OCCUPATIONAL TRAINING PROGRAMS, ESPECIALLY AT THE SECONDARY LEVEL, MAY HELP TO ANSWER SOME OF THOSE QUESTIONS FOR THE MORE THAN 80% OF HIGH SCHOOL STUDENTS WHO WILL NOT GO ON TO GET A COLLEGE DEGREE.

3. SPECIFICALLY, HOME ECONOMICS CAN OPEN THE DOOR TO JOB OPPORTUNITIES, DEVELOPMENT OF SALABLE SKILLS AND SOUND ATTITUDES FOR EMPLOYABILITY THROUGH

4. COOPERATIVE EDUCATION IN THE CLASSROOM COUPLED WITH ON-THE-JOB OR SIMULATED WORK EXPERIENCE MAY MAKE A POSITIVE DIFFERENCE FOR THE CITIZENS OF TOMORROW.

5. OCCUPATIONAL HOME ECONOMICS IS THE NAME GIVEN THESE PROGRAMS OF INSTRUCTION DESIGNED TO PREPARE STUDENTS TO ENTER A CAREER IN A HOME ECONOMICS RELATED OCCUPATION OR

6. HERO. IN MANY STATES, COURSE INSTRUCTION IS REFERRED TO AS OCCUPATIONAL HOME ECONOMICS, WHILE THE TERM HERO REFERS ONLY TO THE EXTRA-CURRICULAR FHA-RELATED STUDENT ORGANIZATION. IN NEBRASKA, HERO REFERS TO BOTH CURRICULAR AND EXTRA-CURRICULAR FUNCTIONS.

7. FIVE AREAS OF STUDY CAN BE INTEGRATED INTO THE HERO PROGRAM DEPENDING ON THE SIZE AND SITUATION FOUND IN EACH COMMUNITY. THESE ARE A NORMAL OUTGROWTH OF ... AND IN COOPERATION WITH, LEARNING EXPERIENCED IN CONSUMER HOMEMAKING COURSES.

8. CAREERS ARE IDENTIFIED IN THE DICTIONARY OF OCCUPATIONAL TITLES BY CLUSTERS, OCCUPATIONS REQUIRING SIMILAR TRAINING, THE PROFESSIONAL AND NON-PROFESSIONAL DIFFERING IN TIME AND DEPTH REQUIRED.

9. FROM SLIDES TAKEN OF ACTUAL HERO STUDENTS IN THE CLASSROOM, ON THE JOB, AND THROUGH VARIOUS ACTIVITIES, THE PROGRAM AND HOW IT WORKS WILL COME TO LIFE--AS IN CHILD CARE WHERE STUDENTS LEARN AND USE TECHNIQUES IN WORKING FOR GROWTH OF CHILDREN IN PHYSICAL AND SOCIAL DEVELOPMENT

10. WHILE SIMULATING INTELECTUAL PROGRESS,

11. CREATIVITY,

12. AND A SPIRIT OF COOPERATIVE INDEPENDENCE, A DEVELOPMENT OF SELF-CONFIDENCE AND SELF-WORTH

13. ALONG WITH A MUTUAL FEELING OF RESPECT FOR LIKE DEVELOPMENT IN THEIR PEERS.

14. HERE, HERO STUDENTS WORK WITH GRADE SCHOOL CHILDREN ON A NUTRITION PROJECT.

15. THE HERO STUDENT ACTUALLY BECOMES A HERO OR HEROINE IN GUIDING COOPERATIVELY THE YOUNGER SET IN THE SCHOOL KITCHENS, STUDYING, PREPARING, SAMPLING, AND CLEANING UP.

16. ONE OF THE MOST READILY AVAILABLE FOR ON-THE-JOB EXPERIENCE OF THE FIVE AREAS IS THAT OF FOOD SERVICE. FEW COMMUNITIES DO NOT HAVE A POSSIBLE TRAINING CENTER IN WHICH STUDENTS CAN GAIN SOME BENEFIT.

17. STUDENTS ARE EXPOSED FIRST-HAND TO THE RIGORS OF DEVELOPING THE NECESSARY SKILLS,

18. SAFE WORKING HABITS.

19. SANITARY PROCEDURES AS REQUIRED BY LAW AND DEMANDED BY CONSUMER SATISFACTION,

20. EFFICIENCY IN WORK HABITS.

21. COOPERATIVE EMPLOYER-EMPLOYEE RELATIONSHIPS,

22. AND THE REALIZATIONS OF WORKING UNDER REAL CONDITIONS.

23. IN THE ABSENCE OF READILY AVAILABLE REAL SITUATIONS, SIMULATED WORK EXPERIENCE CAN ALSO BE BENEFICIAL.

24. GUIDELINES FOR MAINTAINING GOOD CUSTOMER RELATIONS COULD CERTAINLY EVOLVE FROM SOME ROLE-PLAYING BY THIS CHALLENGING THREESOME.

25. PART OF ANY AREA OF INSTRUCTION IN AN OCCUPATIONAL PROGRAM IS THE EMPHASIS ON COMBINING HOMEMAKING AND A CAREER OR A PART-TIME OR AT-HOME ENDEAVOR.

26. SUCH CAN BE THE CASE IN WORKING AS A SEAMSTRESS OR IN AREAS OF TAILORING AND ALTERATIONS.

27. ALMOST ENDLESS POSSIBILITIES OPEN UP FOR RELATED WORK IN CLOTHING AREAS IN FABRIC SHOPS, LAUNDRIES. . .

28. DRYCLEANERS, RETAIL APPAREL SHOPS-----

29. AND IN AREAS OVERLAPPING AND COMBINED WITH HOUSING AND HOME FURNISHINGS

30. WHERE WORK WITH FABRICS CAN MEAN DRAPERY AND CURTAIN CONSTRUCTION,

31. CREATIVITY IN INTERIOR DECORATING.

32. AND RE-CREATION THROUGH UPHOLSTERY.

33. EMPLOYERS AGREE, THIS KIND OF A TRAINING PROGRAM ANSWERS A LOT OF NEEDS.

34. LAST, BUT CERTAINLY NOT LEAST, ENTERS THE REALM OF COMMUNITY SERVICES OPENING DOORS TO THOSE INTERESTED ESPECIALLY IN PEOPLE-TO-PEOPLE CONCERNS AND THE ON-GOING PROCESSES INVOLVED,

35. AS IN CARE OR COMPANIONSHIP TO THE ELDERLY

36. OR PROMOTING PUBLIC RELATIONS THROUGH TOURISM.

37. THE FHA-HERO ORGANIZATION MEANS REINFORCEMENT. HERE THE INSTRUCTOR PREPARES TO BEGIN AN INSTALLATION SERVICE FOR OFFICERS IN A NEWLY-FORMED HERO CHAPTER.

38. THE SERVICE AND RESULTING ORGANIZATION CAN BECOME A BOND OF KINSHIP IN WHICH STUDENTS HELP EACH OTHER IN BECOMING RESPONSIBLE, SELF-SUPPORTING CITIZENS.

39. MONEY-MAKING PROJECTS RELATING TO ANY OF THE FIVE AREAS OF INSTRUCTION CAN SERVE AS A TIME OF FELLOWSHIP, A TIME FOR LEARNING, AND A TIME FOR LEADERSHIP DEVELOPMENT

40. AS WELL AS A PUBLIC RELATIONS THRUST IN WHICH THE COMMUNITY BECOMES AWARE OF THE GOALS AND NEEDS BEING MET;

41. AND IT CAN SERVE AS A FUNDING PROJECT FOR ATTENDANCE AT SPECIAL EVENTS, AS AT THIS RESTAURANT ASSOCIATION CONVENTION

42. WHERE THE STUDENTS MINGLE WITH PEOPLE WHO WORK DAILY IN FOOD SERVICE OCCUPATIONS

43. AND WHO SHOW PRIDE IN THEIR ACCOMPLISHMENTS,

44. AND EVEN OFFER FREE SAMPLES TO TANTALIZE THE PALATE.

45. THIS YOUNG MAN, HEADED IN THE DIRECTION OF FIRST-RATE PASTRY CHEF, FINDS THE CONVENTION INSPIRING AND FILLING - FUL FILLING.

46. CLASSROOM INSTRUCTION AS A SOUND BASIS FOR ANY OCCUPATIONAL PROGRAM, INVOLVES ANSWERING THOSE QUESTIONS NECESSARY FOR EACH INDIVIDUAL STUDENT'S GROWTH IN BECOMING A PART OF THE REAL WORLD OF WORK.

47. THROUGH AUDIO AND CLASS DISCUSSION

48. RELATED TOPICS IN OTHER CLASSES AS WELL AS CONSUMER HOMEMAKING EDUCATION,

49. AND VIDEO PRESENTATIONS, PANELS, AND GUEST SPEAKERS; QUESTIONS OF INSURANCE, TAXES, BENEFITS, UNIONS, APPLICATIONS, INTERVIEWS, AND OTHERS CAN BE AIRED AND CLARIFIED.

50. FIELD TRIPS FOR ON-THE-SPOT QUESTION AND ANSWER SESSIONS;

51. THESE CAN PROVIDE ADDED REINFORCEMENT AND BRING TO LIFE THAT DISCUSSION IN THE CLASSROOM.

52. ADVISORY GROUPS CAN HELP THE OCCUPATIONAL PROGRAM BECOME AT ITS FULLEST, WHAT IT IS MEANT TO BE, AND AT THE SAME TIME BECOME A MAINSTAY OF THE PUBLIC RELATIONS THRUST NECESSARY TO SUSTAIN SUCH A PROGRAM.

53. HELP IS DIRECTLY AVAILABLE TO THE INSTRUCTOR, TOO, THROUGH INITIAL AND CONTINUAL TRAINING IN

54. ESTABLISHING A SOUND HERO PROGRAM.

55. IDEAS, COUNSEL, AND ADVICE CAN BE GAINED THROUGH

56. INDIVIDUAL LEADERSHIP

57. KNOWLEDGEABLE PANELS

58. AND "LETS-TRY-IT-ON-OUR-OWN" JAM SESSIONS.

PEOPLE JUST LIKE YOU AND ME TELL ABOUT A SUCCESSFUL OCCUPATIONAL PROGRAM IN THE FOLLOWING PERSONAL INTERVIEWS.

A STUDENT TELLS ABOUT THE TRAINING BENEFITS FROM BEING EMPLOYED THROUGH THE OCCUPATIONAL CLASS.

STUDENT: The Home Economics Related Occupations class has helped me to get along with my employer and to work with him. When I was first at my training station, I was not capable of accepting criticism and the rap sessions in my class have helped me to accept criticism from my manager and other employees that I work with. I have also learned to work without supervision and accomplish the work that I am supposed to, but one thing that I have learned that to me is very important is promptness and dependability. My manager knows that he can rely on me when he is in a bind and can call on me to work. The class has been very beneficial and has helped me to realize how important my job is.

A HOME ECONOMICS TEACHER DEPICTS THE TEACHING METHODS SHE USES TO MEET INDIVIDUAL NEEDS OF STUDENTS IN OCCUPATIONAL HOME ECONOMICS CLASSES.

TEACHER: Teaching students enrolled in Home Economics Related Occupations has provided me with an opportunity to apply many of the individualized instruction techniques and truly meet the needs of each student. Each student gets out of the class exactly what effort he or she puts into it. He or she is encouraged to select projects which relate to specific concerns and weaknesses that are discovered on the job while working at his or her own pace. Now two years of prerequisite courses have been offered, and I feel these are the key to a quality program, along with personal interviews and applications to determine a true interest in home economics related careers. Community support has been outstanding. All students were able to find positions which interested them. Our advisory council was a great help in implementing up-to-date criteria for curriculum development. It was through these means that the class was so relevant to each and every student.

THE EMPLOYER DESCRIBES HOW THE OCCUPATIONAL PROGRAM PROVIDES ADVANTAGES FOR HIS BUSINESS, THE COMMUNITY AND THE STUDENT'S FUTURE.

EMPLOYER: HERO is more than just a work program. It's a chance for students with career goals in mind to receive training aimed at getting them into supervisory positions. In the HERO program a student receives personalized training from both the teacher and the employer. Each student learns correct procedures in the classroom and then is able to go right to the job and put their knowledge to work. In this way a serious-minded student can be well ahead of the college graduate four years later. From the employer's point of view, one of the real advantages to the

CE 009 051

program is that it provides a trained work force which tends to stay in the community. I have noticed that HERO students are more dependable and more serious about their job than other student employees. They are always willing to learn something new. By the end of the school year they have become versatile and valuable employees.

59. IS THERE A NEED FOR A HERO PROGRAM IN YOUR SCHOOL? JUST LOOK AROUND AND YOU'LL FIND THERE IS. AND WHAT BETTER TIME THAN NOW TO DO SOMETHING ABOUT IT.

TITLE: A NEEDS ASSESSMENT AND TASK ANALYSIS IN ANIMAL SCIENCE IN YUMA COUNTY. FINAL REPORT.

DESCRIPTOR: *NEEDS ASSESSMENT; *TASK ANALYSIS; *ANIMAL SCIENCE; OCCUPATIONAL SURVEYS; EMPLOYMENT PROJECTIONS

IDENTIFIER: YUMA COUNTY; ARIZONA

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 25P.

ABSTRACT: A NEEDS ASSESSMENT AND TASK ANALYSIS IN ANIMAL SCIENCE FOR AGRICULTURAL EMPLOYMENT WAS CONDUCTED IN SOUTHERN YUMA COUNTY. LIVESTOCK PRODUCERS WERE IDENTIFIED AND INTERVIEWED TO DETERMINE: (1) THE NUMBER OF EMPLOYEES NEEDING KNOWLEDGE IN ANIMAL SCIENCE CURRENTLY EMPLOYED; (2) THE ANTICIPATED NUMBER OF EMPLOYEES NEEDING KNOWLEDGE IN ANIMAL SCIENCE; AND (3) THE TASKS PERFORMED BY THE EMPLOYEE. AS A RESULT, 14 EMPLOYERS IDENTIFIED 15 JOB TITLES REQUIRING KNOWLEDGE AND SKILLS IN ANIMAL SCIENCE. OF THE TOTAL 123 EMPLOYEES IDENTIFIED, THE LARGEST NUMBER HAD THE TITLE OF GENERAL FARM LABORER. RESPONDENTS IDENTIFIED 22 ESSENTIAL COMPETENCIES, WITH MAINTENANCE OF EQUIPMENT, CORRALS, AND FENCES AS MOST IMPORTANT. RESULTS OF THE SURVEY PERTAINING TO COMPETENCIES, TASKS, AND EMPLOYMENT APPEAR IN NARRATIVE AND TABULAR FORM. APPENDIXES INCLUDE THE SURVEY INSTRUMENT AND OTHER PROJECT-RELATED MATERIAL. (AUTHOR/NJ)

MINI-GRANT PROJECT RESUME

PROJECT TITLE: A Needs Assessment and Task Analysis in Animal Science in Yuma County.

AGENCY: Arizona Western College

PROJECT DIRECTOR: David E. Cox

DURATION: July 1, 1975 thru June 30, 1976

COSTS:

RCU: $4,845.00 LOCAL: $300.00 TOTAL: $5,145.00

PURPOSE OF PROJECT:

The purpose of the mini-grant project was to identify the number of people employed in animal science and livestock production in Yuma County, Arizona, and determine what job entry level skills were required by the employers of those persons.

DESCRIPTION OF PROJECT:

The project undertaken was to conduct a needs assessment and task analysis in animal science for agricultural employment in Southern Yuma County. Livestock producers were identified and interviewed to determine the following:

a. The number of employees needing knowledge and skill in animal science currently employed.

b. The anticipated number of employees needing knowledge and skill in animal science.

c. The tasks the employee performs.

OUTCOME:

As a result of this project, a total of 14 employers were interviewed acorss Southern Yuma County. These employers identified 15 job titles requiring knowledge and skills in animal science. Of the 123 employees working for livestock producers, the largest number worked under the title of

general farm laborer. Respondents identified 22 essential competencies. Of these, maintenance of equipment, corrals, and fences were the most important. After further study, it was projected by the employers that there would be 127 employees 5 years hence.

GOAL STATEMENT

To conduct a needs assessment and task analysis in the area of animal science needed for agricultural employment in Southern Yuma County.

NEEDS STATEMENT

In 1971 a study was conducted to identify the occupational opportunities and training needs for agricultural employment in selected areas of Arizona. As a result of the above study, Arizona Western College implemented a two-year technician program in Agricultural Equipment Technology.

The same study showed that there were 471 full-time employees needing knowledge and skills in animal science. During the past two years we have seen meat boycotts, tremendous rises in the live cattle market, and sudden falls in the live cattle market. It is the basic purpose of this proposal to develop a model for conducting a needs assessment and task analysis in this area for the agricultural program planning at Arizona Western College.

The current animal science curriculum is based primarily upon university transfer requirements and apparently does not reflect the manpower needs of this county. The results of this project could be used by the agricultural educators in all community colleges to assess local needs and perform task analysis activities in any occupation's subject matter area. The data gathered as a result of this project will be used to plan and develop a competency based on animal science curriculum in the Division of Agriculture, Arizona Western College.

OBJECTIVES

1.1 By June 30, 1976, a needs assessment and task analysis in the area of animal science for agricultural employment in Yuma County will be conducted.

ACTIVITIES

1.1.1. Identify the potential employers of animal science graduates in Yuma County.

1.1.2. Determine the number of people needed to fill immediate needs in animal science related occupations in Yuma County.

1.1.3. Determine the number of people now employed full-time in animal science related occupations in Yuma County.

1.1.4. Determine the knowledge and skills needed as expected by employers in the animal science area.

1.1.5. Determine the tasks conducted by employees in the animal science area.

1.1.6. Develop a basis for evaluation, and improving the animal science program at Arizona Western College.

1.1.7. Disseminate the data gathered to all Arizona community colleges, and the University of Arizona.

METHODOLOGY

The project director advertised and secured two (2) agriculture majors from Arizona Western College to serve as interviewers for the project (see appendix A). The project director, along with the interviewers, identified livestock producers in Southern Yuma County (see appendix B). The criteria used were that the producer must be a commercial producer, and employ at least one employee.

The data collection instrument was a revised form of the instrument used in the 1971 study conducted by the Department of Agricultural Education, the University of Arizona (see appendix C-D).

A preliminary letter was mailed (see appendix E) to each producer to solicit his cooperation in the project and to inform him that one of the student interviewers would contact him to arrange for the personal interview. Each producer who consented was contacted by the student interviewer. A personal interview was conducted and the data collection instrument was compiled by the interviewer.

Upon completion of all interviews the data gathered were summarized and are presented in the Summary of Findings.

SUMMARY OF FINDINGS

A total of 123 persons requiring knowledge and skills in animal science were employed by the 14 livestock producers surveyed. Of this number, 112 were employed on a full-time basis.

A total of 15 different job titles were identified among the 112 full-time employees identified.

The task that received the most emphasis from the employers was maintenance of equipment, corrals, and fences; followed closely by construction of equipment and housing.

The remaining job entry level knowledge and skills are listed below in order of most to least important:

3. Feeding systems
4. Environmental conditions conducive to good health
5. Design and construction
6. Body process of nutrition
7. Characteristics of healthy animals
8. Food nutrients and their sources
9. Ration formulation
10. Symptoms of common diseases and parasites
11. Treatment of common diseases and parasites
12. Livestock handling
13. Diseases
14. Management of livestock operation
15. Marketing of livestock products (meat, milk, wool, eggs)
16. Processing of livestock products (meat, milk, wool, eggs)
17. Breeding problems
18. Genetics
19. Reproductive morphology
20. Selection of breeding stock
21. Artificial insemination
22. Breeding skills
23. Breeding farm animals

Table I presents the employment in animal science by job title in Southern Yuma County.

TABLE I

EMPLOYMENT IN ANIMAL SCIENCE BY JOB TITLE
IN SOUTHERN YUMA COUNTY

JOB TITLE	Number of employees needing knowledge and skill in animal science FULL-TIME	PART-TIME	TOTAL
1. Cattle feeder	8	2	10
2. Cattle Foreman	4	-	4
3. Cowboy	11	-	11
4. Feed mill operator	5	1	6
5. General farm laborer	37	4	41
6. General maintenance	2	-	2
7. Manager (owner)	14	-	14
8. Manager (asst.)	5	-	5
9. Mechanic	2	-	2
10. Milker	1	1	2
11. Mill foreman	6	-	6
12. Production manager	1	-	1
13. Swine feeder	1	1	2
14. Trainee	-	1	1
15. Farrow house manager	1	-	1

Table I shows that the largest number of employees are clustered into the job title general farm hand. The fewest number of employees in animal science in Southern Yuma County are required under the job title farrow house manager.

Table 2 shows the competencies needed by animal science employees in Southern Yuma County.

TABLE 2

ANIMAL SCIENCE COMPETENCIES NEEDED BY EMPLOYEES IN SOUTHERN YUMA COUNTY

Animal Science Competencies	Total Number of Employees Needing Each Competency
1. Breeding Farm Animals	
A. Genetics	5
B. Reproductive morphology	9
C. Diseases	9
D. Breeding problems	2
E. Artificial insemination	10
F. Breeding skills	7
G. Selection of breeding stock	6
2. Livestock Feeding and Nutrition	
A. Body processes of nutrition	36
B. Food nutrients and their sources	33
C. Ration formulation	33
D. Feeding systems	38
3. Animal Sanitation, Disease, and Parasite Control	
A. Characteristics of healthy animals	35
B. Symptoms of common diseases and parasites	33
C. Treatment of common disease and parasites	33
D. Environmental conditions conducive to good health	38
4. Housing and Equipment	
A. Maintenance of equipment, canals, and fences	43
B. Construction of equipment and housing	34
C. Design and construction	37
5. Management of Livestock Operation	32
6. Processing of Livestock Products (Meat, milk, wool, etc.)	21

TABLE 2 (cont)

Animal Science Competencies	Total Number of Employees Needing Each Competency
7. Marketing of Livestock Products (Meat, milk, wool, eggs)	22
8. Livestock Handling	33

Table 2 shows that the knowledge and skills required by the most number of employees is maintenance of equipment. The least number of employees required knowledge and skills in genetics.

Table 3 reveals a comparison of the number of employees by job title and the anticipated number five years hence.

TABLE 3

THE NUMBER OF EMPLOYEES BY JOB TITLE AND ANTICIPATED NUMBER FIVE YEARS HENCE

	Number of Employees			
	Currently		Five Years Hence	
	Full-Time	Part-Time	Full-Time	Part-Time
Cowboy	11	0	18	0
General Farm Hand	37	4	-	-
Owner-Manager	14	0	24	0
Feed Mill Operator	5	1	7	0
Cattle Feeder	8	2	10	0
Swine Feeder	1	1	-	-
Mill Foreman	6	0	-	-
Production Manager	1	0	-	-
General Maintenance	2	0	-	-
Cattle Foreman	4	0	-	-
Asst. Manager	5	0	6	0
Trainee	0	1	-	-
Milker	1	1	-	-
Mechanic	2	0	-	-

RECOMMENDATIONS

Based upon the findings of this research mini-grant, and given the inherent limitations, the following recommendations are offered:

1. The Animal Science curriculum at Arizona Western College be restructured to emphasize those competencies (knowledge and skills) identified by this project.

2. A project of this type be conducted in the area of Plant Science.

3. A further study be completed so that the identified knowledge and skills may be articulated between the secondary vocational agriculture programs and the agriculture department at Arizona Western College.

APPENDIX A

ARIZONA WESTERN COLLEGE

P. O. BOX 929
YUMA, ARIZONA

POSITION NOTICE

DATE: October 8, 1975

SUBJECT: Temporary Position Opening (80 hours maximum)

POSITION TITLE: Research Interviewers (2)

SALARY: $5.00 per hour

QUALIFICATIONS: Must be a sophomore level student planning to major in Agricultural Education at a university. Course work completed or in progress in Animal Science preferred.

DUTIES AND RESPONSIBILITIES:

This is a research oriented position requiring a basic knowledge of Animal Science and the ability to meet and interview livestock producers. The employee must attend a training session designed to prepare the employee with basic skills in data collection and descriptive research. The interviewer will collect raw data utilizing the interview/questionnaire method and report to the Project Director.

APPLICATION DEADLINE:

October 22, 1975

STARTING DATE: November 1, 1975

ADDRESS INQUIRIES OR APPLICATIONS TO:

Mr. David E. Cox, Chairperson
Division of Human and Agricultural Sciences
Arizona Western College
P. O. Box 929
Yuma, Arizona 85364

APPENDIX B

Employers and livestock producers interviewed during this project:

EMPLOYERS	BUSINESSES
Louis Daily	Lazy T-7 Cattle Company
Frank Clayton	Clayton Livestock
Tom Pritchard	Pritchard Farms
Louis Daily	Lou-Don Mill and Livestock
Joe Daily	Joe Daily Hog Farms
Bud Palmer	B. C. Systems
Toby Sloan	P. K. Cattle Feedyard Co.
Bruce Gwynn	Mill Iron Cattle Company
Tom Edwards	C & E Cattle Co., Inc.
Keith Lenard	Lenard and Son Cattle Co.
Bill Britain	Britain and Sons Cattle
Dick Combs	Combs Dairy

APPENDIX E

AWC

ARIZONA WESTERN COLLEGE

POST OFFICE BOX 929 PHONE: 726-1000 YUMA, ARIZONA 85364

DIVISION OF HUMAN AND AGRICULTURAL SCIENCES

December 18, 1975

Dear Livestock Producer:

The Agriculture Department of Arizona Western College and the University of Arizona are involved in a research project funded by the Arizona Department of Education. The purpose of the project is twofold:

1. To identify the number of persons in the AWC service area that are employed in positions requiring knowledge and skills in the field of Animal Science.

2. To identify the competencies that are required for job entry into those occupations in livestock production or Animal Science.

I would like to solicit your support in this project. We feel that once this data is gathered, we at Arizona Western College can alter our on-going Animal Science Program, and provide the livestock producers in Yuma County with a supply of well-trained personnel.

The data will be gathered by two agriculture students from Arizona Western College. They will contact you by telephone in the near future, to arrange a convenient time for the interview. The interview will be centered around a developed questionnaire. It will only take about twenty minutes of your time, and all data collected will be in statistical form and strictly confidential.

The second step will occur in January or February of 1976, and at that time we will attempt to identify the skills that you feel are necessary for an employee to possess to be hired by your firm.

Again, I hope that you will support our efforts in this project, and if you have any questions, please contact me at 726-1000, Ext. 218. Thank you for your assistance in our program improvement.

Sincerely,

David E. Cox
Chairman

TITLE: A SURVEY AND JOB DESCRIPTION OF EMPLOYMENT OPPORTUNITIES FOR THE TRAINABLE MENTALLY HANDICAPPED IN MESA, ARIZONA. FINAL REPORT.

DESCRIPTOR: *OCCUPATIONAL SURVEYS; *EMPLOYMENT OPPORTUNITIES; *TRAINABLE MENTALLY HANDICAPPED; *TASK ANALYSIS; EMPLOYMENT QUALIFICATIONS; INDIVIDUAL CHARACTERISTICS; UNSKILLED OCCUPATIONS

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 50P.; PAGES 30, 45, AND 51 CONTAINING DATA IN TABULAR FORM WERE NOT REPRODUCIBLE AND WERE REMOVED. THEY ARE NOT INCLUDED IN THE PAGINATION. PAGE 20 WAS NOT REPRODUCIBLE AS IT APPEARED IN THE ORIGINAL DOCUMENT AND WAS RETYPED AT THE CENTER FOR VOCATIONAL EDUCATION.

ABSTRACT: THE OBJECTIVES OF THIS PROJECT WERE TWOFOLD: (1) TO IDENTIFY THE SPECIFIC CHARACTERISTICS WHICH THE TRAINABLE MENTALLY HANDICAPPED INDIVIDUAL NEEDS TO OBTAIN EMPLOYMENT, AND (2) TO IDENTIFY THOSE AREAS IN WHICH THE TRAINABLE MENTALLY HANDICAPPED COULD FIND EMPLOYMENT. A QUESTIONNAIRE WAS ADMINISTERED TO A RANDOM SAMPLE OF 20 PERCENT OF THE AREA BUSINESSES KNOWN TO EMPLOY BUS BOYS, DISHWASHERS AND KITCHEN HELPERS, MAIDS, CARPENTER'S HELPERS, ASSEMBLY LINE WORKERS, GROUNDSKEEPERS, CAR WASH ATTENDANTS, AND JANITORS. THIS REPORT CONTAINS TABULATED DATA SHOWING THE NUMBER AND TYPE OF HANDICAPPED INDIVIDUALS HIRED PRESENTLY AND IN THE PAST BY LOCAL BUSINESSES AND THE NUMBER OF EMPLOYERS WHO SAID THEY WOULD HIRE TRAINABLE MENTALLY HANDICAPPED INDIVIDUALS. NARRATIVE REPORTS ARE INCLUDED FOR EACH OF THE EIGHT OCCUPATIONAL AREAS. OUTCOMES INDICATED THAT OF THE EIGHT OCCUPATIONAL AREAS INVESTIGATED, ONLY THE AREA OF CARPENTER'S HELPER WOULD NOT BE CONTUCIVE FOR EMPLOYMENT. THE APPENDIX CONSISTS OF THE INTERVIEW SCHEDULE AND TABLES WHICH INDICATE EMPLOYERS' RATINGS OF THE AFFECTIVE, COGNITIVE, AND PSYCHOMOTOR CHARACTERISTICS NEEDED FOR EMPLOYMENT IN EACH OF THE EIGHT AREAS. FOREWORD

This survey was conducted for the many handicapped students in the Mesa Public Schools. Like any project, its success is dependent upon the tremendous efforts of many concerned individuals. For this reason, I would like to thank the employers who participated in the study, and especially thank the following individuals without whose assistance this project would have never been as successful.

Dr. Alvord H. France

PROJECT TITLE: A Survey and Job Description of Employment Opportunities for the Trainable Mentally Handicapped in Mesa, Arizona

AGENCY: Mesa High School District #207
549 North Stapley Drive
Mesa, Arizona 85203

PROJECT DIRECTOR: Ronald R. Reinarn

DURATION: July 1, 1975 - June 30, 1976

COSTS:

RCU $791.47 LOCAL $1180.59 TOTAL $1972.06

PURPOSE OF PROJECT: To determine types of vocational placement available in the Mesa Public School area for trainable mentally handicapped individuals.

DESCRIPTION OF PROJECT: Employer's in eight of the thirty-six training areas being taught at Parkway School, Mesa, Arizona will be interviewed to determine if they would hire the trainable mentally handicapped individual.

OUTCOMES: The business clusters which the trainable mentally handicapped individual has the greatest opportunity for obtaining employment are: assembly-line, bus boy, car wash, dishwasher, grounds keeper, janitorial, and maid. The carpenter's helper area did not prove to be conducive for employment.

A SURVEY AND JOB DESCRIPTION OF

EMPLOYMENT OPPORTUNITIES FOR THE

TRAINABLE MENTALLY HANDICAPPED

IN MESA, ARIZONA

INTRODUCTION

Every student, upon entering the school system, is seeking educational training which will prepare him for employment. For many, the emphasis of vocational training does not begin until their latter years, but for the trainable mentally handicapped this training begins their first day of school and continues throughout the rest of their lives. Because the time required for teaching vocational skills to the trainable mentally handicapped is much greater in duration, it is imperative that they receive the necessary skills to obtain employment and a position be available upon completion of their training.

Available research is extremely limited regarding the employability of the trainable mentally handicapped student in the Mesa area. The one study[1] which has been conducted for this geographic area projects there will be an increase in the semi-skilled, clerical, and sales area but deals only with the normal population. Moreover, it does not specify exactly what positions will most likely be available or what type of training is required to obtain employment for the trainable mentally handicapped.

PROJECT DESIGN

This project was developed to accomplish two objectives: (1) to identify the specific characteristics which the trainable mentally handicapped individual needs to obtain employment, and (2) to identify those areas which the trainable mentally handicapped could find employment.

Thirty-six different training areas are being taught at Parkway School, Mesa, Arizona. Of these, eight were selected for this study: bus boy (311.878),

BEST COPY AVAILABLE

dishwasher-kitchen helper (318.887), maid (323.887), carpenter's helper (860.887), assembly-line worker (706.887), grounds keeper (407.884), car wash attendant (915.137), and janitor (382.884).[2] Numerous agencies were contacted both at the state and local levels to identify specific employers who were hiring individuals in these areas. All agencies suggested using the yellow pages of the telephone directory to determine the employers of each business cluster. A random sample of at least 20% of the known businesses was then drawn. The randomly selected employers were contacted by phone to explain the purpose of the study. Also, during this time it was explained that the necessary information would be obtained by means of a questionnaire. An appointment was made with the employer for either filling out the questionnaire then or leaving it and picking it up at another predetermined time. If the questionnaire was delivered and picked up later, a full explanation was given to ensure the employer understood in total the purpose of the study and the precise method in filling it out.

The questionnaire was designed to obtain the following information:

1. Willingness of the employer to hire a trainable mentally handicapped individual.

2. Projected figure of new employees needed during the next year and the number of trainable mentally handicapped they would consider hiring.

3. Personal characteristics expected for hiring (affective).

4. Educational skills needed for employment (cognitive).

5. Specific vocational skills needed for employment (psychomotor).

An example of one of the questionnaires used in the study can be found in the Appendix on page 20. The first page asked general information about

BEST COPY AVAILABLE

the business and became more specific about the hiring of the trainable mentally handicapped either on a full or part time basis. The second, third, and fourth pages listed suggested affective, cognitive, and psychomotor characteristics, respectively, for each business. The employer was asked to select the degree of frequency for each characteristic, the degree of importance, etc., and to write its corresponding number in each column.[3] The first three pages were the same for each of the eight different business clusters with the fourth page listing the psychomotor characteristics specific to each business.

In order to facilitate curriculum planning, all data was compiled and disseminated to the Principal of Parkway School, the Director of Vocational Education, and the Director of Special Education for the Mesa Public Schools, the Director of Mesa Association for Retarded Citizens, and the Director of Dissemination and Testing, Arizona Department of Education.

RESULTS

Figure I on page 5 shows the trainable mentally handicapped individuals who have been hired in all business areas except in the grounds keeper and carpenter's helper areas. The other six areas have employed between two and four mentally handicapped individuals in each area, but the employers did not know if they were educable or trainable. Also, no information was available as to how long ago these individuals were employed.

A comparison of Figure I and Figure II on page 6 shows that approximately one-half of the handicapped who were hired are no longer working for the same employer. Of the six business areas which had hired mentally handicapped individuals, only the maid and assembly-line areas still retained them.

Numerous reasons were given as to why they were no longer employed. Generally they had either moved, were unable to associate with fellow workers, or were unable to perform the job adequately.

Figure III on page 8 indicates the best possibility of employment is in the dishwashing area. The employer's of carpenter's helpers stated that the competition was extremely difficult in entering the carpenter's union and they questioned whether or not the trainable mentally handicapped could ever develop the necessary skills needed for entrance. Except for the assembly-line and car wash areas, many employers stated they would like to hire the trainable mentally handicapped individual on a part-time basis and then gradually move him to full-time work.

Figure IV on page 9 shows there is a strong interest in hiring the trainable mentally handicapped individual as was shown in Figure III, but not as many employers were willing to hire if another person was present to assist in their training. The main reason given by employers was that they wanted their employees to be trained the way they thought best. The best area of employment was again in the dishwashing area. The one employer who said he would hire an individual as a carpenter's helper was non-union. The other union businesses felt they would not be able to establish the necessary skills to enter the carpenter's union.

Results section will continue with more detailed information on each business area and the specific characteristics employers are especially interested in.

TOTAL	15	18	9	10	8	5	3	2	35	35

Assembly Line

The researcher identified 19 businesses in the assembly-line area. It was decided to randomly sample at least 75% of the businesses which meant all 19 businesses had to be contacted before 15 could be found who were willing to participate in the study. A high percentage was chosen in this area for it was thought to be an excellent source of employment. The affective characteristics most employers rated important were:

- cooperate with supervisor
- follows directions
- completes assignments
- asks if does not understand
- observes safety precautions
- returns from breaks promptly
- cleans up work area
- arrives and leaves work on time

Of all business clusters studied, the assembly-line area required the most skill in cognitive development. Many of the mobile home industries required reading of blueprints, adding and subtracting materials, and writing accounts of work performed. More detailed information can be found on page of the Appendix.

The psychomotor characteristics are not listed, for each business was unique in itself. Fine motor coordination and the use of microscopes was essential for businesses which manufacture micro-circuits. Many food industries required only the use of gross motor skills and physical stamina for many jobs required packaging and lifting of items to fifty pounds.

Bus Boy

The researcher identified 242 businesses in the bus boy area. It was decided to randomly sample 12.5% of the total population which meant 86 businesses were contacted before 30 employers were willing to participate in the study. After contacting 10-15 businesses in the quick service foods, it was decided not to contact any others for they had no bus boys. The affective characteristics employers rated most important were:

- cooperate with fellow workers
- cooperate with supervisor
- follows directions
- asks if does not understand
- accepts orders agreeably
- efficient in use of time
- completes assignments
- observes safety precautions
- clears up work area
- arrives and leaves work on time

Employers rated "reads signs," "reads short notes or paragraphs," and "tells time" as the most important skills in the cognitive area. Of these three, "tells time" was rated the highest in frequency. Additional information can be found on page 27 of the Appendix.

The most important psychomotor skills were "collects dirty dishes" and "replenishes clean linens, glasses, silverware, etc." Also of importance were cleanliness and neat in appearance.

Carpenter's Helper

There were nine businesses identified in the carpenter's helper area but only one was willing to participate in the study. After contacting all employers, most stated the trainable mentally handicapped individual would never develop the

proficiency to enter the carpenter's union and consequently refrained from participating in the study. Specific information can be obtained by referring to page 29 of the Appendix.

Car Wash

The research identified 11 businesses in the car wash area. All of the 11 businesses had to be contacted before 7 employers were willing to participate in the study. The affective characteristics employers rated most important were:

- cooperate with fellow workers
- cooperate with supervisor
- follows directions
- asks if does not understand
- accepts orders agreeably
- accurate in work
- efficient in use of time
- completes assignments
- observes safety precautions
- has own transportation
- cleans up work area
- arrives and leaves work on time

Employers rated "reads signs" and "measuring items in quarts or gallons" as being important in the cognitive area. Of these "reads signs" was rated as being used more frequently for stopping and starting machinery.

The following psychomotor skills were rated the most important and frequently performed:

- empties trash from car
- wipes interior of car
- washes windows
- dries car

These skills also had to be performed very quickly for they encompassed most of the job area and were crucial for work quality.

BEST COPY AVAILABLE

Dishwasher

The researcher identified 242 businesses which may have dishwashers. It was decided to randomly sample 12.5% which meant 86 businesses were contacted before 30 were willing to participate in the study. The quick service food businesses were not among the 86 initially contacted. The affective characteristics which most employers rated very important and frequently used were:

- cooperate with fellow workers
- cooperate with supervisor
- follows directions
- asks if does not understand
- accepts orders agreeably
- efficient in use of time
- completes assignments
- observes safety precautions
- cleans up work area
- arrives and leaves work on time

The most important cognitive areas were "reads signs (stop, go)" and "tells time." Almost one-half of the employers did not even consider the cognitive areas as being applicable to the job.

Except for "replenishes linen supply" and "washes or peels vegetables" most employers rated the listed psychomotor characteristics as very important with "stacks and sorts dishes" requiring the most speed. See page 37 of the Appendix for more detailed information.

Grounds Keeper

The researcher wanted to interview at least 50% of the employers in this area but only two questionnaires were returned. This constituted 25% of the total population. It is difficult to draw any definite conclusions from such a small sample, thus referrals should be made to page 38 of the Appendix for more information.

Janitor

The researcher identified 32 businesses in the janitorial area. It was necessary to contact 20 employers before six were willing to participate in the study. The affective characteristics which most employers rated very important were:

- cooperate with fellow workers
- cooperate with supervisor
- follows directions
- asks if does not understand
- accepts orders agreeably
- accurate in work
- efficient in use of time
- completes assignments
- arrives and leaves work on time

Most cognitive characteristics were either not applicable, slight in importance, or seldom used in the janitorial businesses. Except for "doing minor maintenance" and "ordering supplies" most psychomotor characteristics which were listed were rated very important and performed frequently. The speed with which they were performed varied with employers.

Page 20 was retyped at The Center for Vocational Education.

Maid

The researcher identified 75 businesses which employed maids. It was decided to randomly sample 20% of the businesses which meant 47 businesses had to be contacted before 16 employers would participate in the study. Another reason for contacting so many businesses was because many of the motels are not large enough to employ maids. Thus, the husband and wife who are the owners or operators of the motel perform all maid duties. It should also be noted that the motels who hire maids may only do so in the winter months and then discharge their employees during the summer months.

The affective characteristics employers rated very important were:

- cooperate with fellow workers
- cooperate with supervisor
- follows directions
- asks if does not understand
- accepts orders agreeably
- efficient in use of time
- completes assignments
- observes safety precautions
- seeks another task
- cleans up work area
- direct contact with public

The cognitive characteristics rated most important were "reads short notes or paragraphs" and "uses the telephone." About one-half of the employers rated the other characteristics as not applicable or of a lesser degree of importance and frequency.

Except for "washes walls and woodwork" and "hangs drapes" most employers

of the maid area rated the listed psychomotor characteristics as very important and frequently performed.

CONCLUSION

This researcher believes that many trainable mentally handicapped individuals are not currently employed in our local businesses because past training was not adequate to prepare them for employment. With the increasing number of highly skilled teachers entering this educational field, and with the assistance of the vocational training programs, I believe this trend will quickly reverse itself. For as can be seen from Figure II and IV, there is a definite willingness of employers to hire the trainable mentally handicapped individual once he has been provided adequate training.

Of the eight business areas investigated, only one, carpenter's helper, would provide limited employment, if any. The other seven areas, assembly-line work, bus boy, car wash, dishwasher, grounds keeper, janitorial, and maid service has shown to be excellent areas of employment once the students have received adequate training.

An integral part of this training, which all students must receive, is in the affective area. The characteristics which were rated very important and having a high degree of frequency on the job for all eight business clusters were:

- cooperate with fellow workers
- cooperate with supervisor
- follows directions
- asks if does not understand
- accepts orders agreeably

- efficient in use of time
- completes assignments
- observes safety precautions
- cleans up work area
- arrives and leaves work on time

Except for a few select assembly line businesses, the cognitive skills were not as important as either the affective or psychomotor skills for employment. Those mentioned most often by the eight business clusters were "reads signs (stop, go)" and "tells time." Other cognitive skills were mentioned as being important but were for only select businesses in the community or were used infrequently on the job.

Most employers stated that the lists of psychomotor characteristics which they rated for this study, was an excellent representation of the duties their employers would perform. Therefore, it is suggested that these lists could be used as an initial guide in either developing any of the seven business clusters for training areas or in comparing them with existing curriculums to ascertain if programming is concurrent with employer's expectations.

The one area of the study which most employers found confusing was rating the skills to their level of difficulty. Most employers said this would depend on the individuals capabilities in learning a task and thus used the rating of "2." Because they did not totally understand this portion and clarification on the researchers part did not seem to help, they decided on the middle of the road response. Because of this fact, this data was not included in the results discussion.

Also, the project was designed for the employer to fill out the questionnaire while the researcher waited. This was to ensure a much greater return

and to clarify any questions which may arise. This was amended to where the questionnaire was dropped off and picked up at a later predetermined time, whence any questions needed to be answered were done then. This change was very important for many employers initially said they would not participate in the study but would gladly complete the questionnaire when time was available. Because the questionnaire was picked up after completion, this alteration did not affect the return.

Based upon the information from this study, it is the researchers opinion that trainable mentally handicapped individuals upon receiving adequate training in any of these areas, assembly-line, bus boy, car wash, dishwashing, grounds keeper, janitorial, or maid service, could be employed by businesses within the Mesa area.

r) Cleans up work area			
s) Direct contact with public			
t) Arrives and leaves work on time			
u) Other			

COGNITIVE CHARACTERISTICS

Please rate the following characteristics pertinent to your employees using the following scale. If an item does not apply, please indicate N/A (not applicable).

FREQ (Frequency)	IMP (Importance)	DIFF (Difficulty)
(1) Often	(1) Very	(1) Very
(2) Occasionally	(2) Moderate	(2) Average
(3) Seldom	(3) Slight	(3) Easy

	FREQ	IMP	DIFF
a) Reads signs (stop, go, off)			
b) Reads short notes or paragraphs			
c) Adds numerals			
d) Subtracts numerals			
e) Makes change with money			
f) Tells time			
g) Writes name and address			
h) Writes more than name and address			
i) Measures items in inches, feet or metric			
j) Measures quantities in quarts, gallon or metric			
k) Uses telephone for sending or receiving messages			
l) Other			

PSYCHOMOTOR CHARACTERISTICS

MAID

Please rate the following characteristics pertinent to your employees using the following scale. If an item does not apply, please indicate N/A (not applicable).

FREQ (Frequency)	IMP (Importance)	DIFF (Difficulty)	SPED (Speed)
(1) Often	(1) Very	(1) Very	(1) Quickly
(2) Ocassionally	(2) Moderate	(2) Average	(2) Moderately
(3) Seldom	(3) Slight	(3) Easy	(3) Leisurely

	FREQ	IMP	DIFF	SPED
a) Vacuum Carpets				
b) Shampoo Carpets				
c) Dust furniture, curtains				
d) Change and make beds				
e) Replace clean classes				
f) Straighten room				
g) Mop bathroom floors				
h) Clean and sanitize sink and stool				
i) Replensihes towels and soap				
j) Washes walls and woodwork				
k) Clean mirror				
l) Empties waste baskets				
m) Sorts, counts, folds and carries linen				
n) Moves furniture				
o) Replaces light bulbs				
p) Hangs drapes				
q) Other

DESCRIPTIVE NOTE: 45P.; RELATED DOCUMENTS VT 103 247 AND VT 103 248 IN THIS ISSUE.

ABSTRACT: THE PROJECT REVIEWED AND ASSESSED THE 72 VOCATIONAL RESEARCH AND EXEMPLARY PROJECTS CONDUCTED IN OREGON DURING FISCAL YEARS 1970-75 IN ORDER TO DISSEMINATE INFORMATION ABOUT SUCCESSFUL PROJECTS. EVALUATIVE CRITERIA, INSTRUMENTATION, AND PROCEDURES WERE DEVELOPED BY THE PROJECT STAFF AND REVIEWED BY EXTERNAL EVALUATORS. THESE WERE THEN TESTED AND REVISED. THE TWO PRODUCTS RESULTING FROM PROJECT ACTIVITY ARE: (1) A HANDBOOK OF INFORMATION ON TRANSPORTABLE VOCATIONAL PRODUCTS THAT RESULTED FROM SELECTED RESEARCH AND EXEMPLARY PROJECTS, AND (2) A TECHNICAL REPORT OF AN EVALUATION OF THESE SELECTED PROJECTS AND THEIR PRODUCTS AND PROCESSES. MAJOR ACCOMPLISHMENTS ARE SUMMARIZED FOR EACH OF FOUR REVIEW PERIODS DURING THE YEAR'S DURATION OF THE PROJECT. FINDINGS OF THE STUDY ARE PRESENTED IN 13 TABLES ACCORDING TO SUCH VARIABLES AS CAREER DEVELOPMENT LEVEL, FISCAL CHARACTERISTICS, CONTRACTING AGENCIES, AND INSTRUCTIONAL LEVEL. CONCLUSIONS AND RECOMMENDATIONS FOR FUTURE VOCATIONAL RESEARCH AND EXEMPLARY PROJECTS ARE INCLUDED IN THE REPORT. (AUTHOR/RG)

ABSTRACT

TITLE: A Review of Vocational Research and Exemplary Projects

INSTITUTION: Oregon State University

PROJECT DIRECTOR: Larry J. Kenneke

Address: Industrial Education
Batcheller Hall 301
Corvallis, Oregon 97331

Telephone: 754-2733

PROJECT DURATION: August 15, 1975 through June 30, 1976

COSTS:

Federal	Local	Other	Total
$20,773.00	$7,737.80	-----	$28,510.80

NUMBER OF STUDENTS AFFECTED: None

NUMBER OF STAFF INVOLVED: 14

PROJECT DESCRIPTION:

Under the auspices of the Oregon State Department of Education, seventy-two vocational research and exemplary projects have been conducted during fiscal years 1970 through 1975. However, information about successful projects or products has not been readily accessible for transportability to other environments. It was the intention of this project to resolve these problems.

PURPOSE:

The primary purpose of this project was to produce two documents: (1) a handbook of information on transportable vocational products and processes that resulted from selected research and exemplary projects and (2) a technical report of an evaluation of these selected exemplary and research projects and their products and processes. The former document was designed for widespread general distribution and the latter for limited, controlled distribution.

PROCEDURES AND OUTCOMES:

Evaluative criteria, instrumentation, and procedures were developed by the project's staff and reviewed by external evaluators. These were then pilot tested, revised, then field tested and revised. Selected projects (up to 72) were reviewed and documented in three phases: (1) extraction of data from existing proposals and reports on each project; (2) collection of additional data and verification of a sample of data at institutions that conducted the vocational research and exemplary projects; and (3) preparation of the evaluative information for the handbook and technical report. The external evaluators reviewed the evaluative data and the data collection by teaming with members of the project staff on the evaluations of selected projects. Two documents resulted from project activity: (1) a handbook titled, Promising Practices in Oregon Career and Vocational Education and (2) a technical report.

A. BACKGROUND

A. STATEMENT OF THE PROBLEM

Vocational research and exemplary projects facilitate improvement of career/vocational education in Oregon. Nearly all such projects have been of significant benefit to the schools, colleges, or agencies conducting them. Unfortunately, however, information about successful projects or project products has not been readily accessible for transportability to other environments.

There has not been concerted and systematic effort to review and assess such funded projects so that promising practices could be disseminated to other settings. Furthermore, exemplary practices which have resulted in improved programs and/or program elements have not been satisfactorily identified. Finally little has been done to identify and catalog processes and products which are currently making an impact on student needs. It was the intention of this study proposal to resolve these problems.

B. GOALS AND OBJECTIVES

In order to ameliorate the deficiency described above, two primary, or product, goals were achieved. These product goals were concerned with documents that will be outputs of this project. The goals were:

1. Technical Report of the Evaluation of Research and Exemplary Projects on Career Education in Oregon: Fiscal Year 1971-1975. The general contents of this documents are:
   a. Problem and objectives of project,
   b. Methodology (population, sample, criteria, instrumentation, procedures, and analysis),
   c. Findings
   d. Conclusions and recommendations (including alternative dissemination

strategies), and

e. Appendix (evaluative data on each of the research and development projects that are evaluated).

2. Handbook of Career Education Practices and Materials: Research and Exemplary Efforts in Oregon during Fiscal Years 1971-1975. The general contents of this document are:

   a. Overview and

   b. Description of promising materials and practices, including:

      1. Student outcomes,

      2. Other outcomes, such as changes in behaviors of teachers, counselors, etc,.

      3. Procedures,

      4. Materials (including availability),

      5. Adoption strategy,

      6. Resource requirements (quantity, i.e., number and amount of time, quality of people, space, equipment, materials necessary for implementation of the innovation—costs vary by location and when the innovation is installed).

      7. Environment and population,

      8. Assessment of effectiveness, effficiency, transportability, and innovativeness, and

      9. Resource person(s).

The first document the Technical Report is a comprehensive description of this project and its findings, i.e., the effectiveness, efficiency, transportability, and innovativeness of the products and/or practices in each of the research and exemplary projects that are evaluated and alternate dissemination strategies. Because of the nature of the information, distribution of this document is limited

and controlled. The second document, the Handbook, contains pertinent information needed by teachers and administrators to decide whether or not a promising practice and/or product may be appropriate for adoption (and adaptation, if necessary or desirable).

Promising Practices in Oregon Career and Vocational Education, referred to as the Handbook, describes 40 Practices selected according to the following criteria: (1) The Practices address a significant problem in career education. (2) The Practice is effective in its environment, and (3) the Practice is transportable (i.e., it can be adapted and communicated). The Handbook is organized under the following section headings: Career Awareness, Career Exploration, Career Preparation, and Career Specialization. A Promising Practice is described in the first section appropriate for it. It is then cross-referenced at the end of each subsequent section that is relevant to it. For example, a Practice that concerns both career awareness and career exploration in the middle school appears in the career awareness section. At the end of the career exploration section, reference is made to the location of the Practice in the awareness section. In the dated index, the Practice is identified under career awareness, exploration, and the middle school. The original Handbook index is dated, so any revisions or additions to the Handbook would show the date and be accompanied by a revised (dated) index.

B. MAJOR ACCOMPLISHMENTS

This section is organized according to milestones and activities accomplished. They are reported according to the following review periods:

August 15, 1975 to November 30, 1975
December 1, 1975 to January 30, 1976
February 1, 1976 to March 30, 1976
April 1, 1976 to June 30, 1976

1. AUGUST 15, 1975 to NOVEMBER 30, 1975

a. Milestone(s) and Events

(1) Milestone A, notification of contract award, was scheduled in the approved proposal for August 15. The actual notification of grant award was issued by the Oregon Department of Education on November 6. However, on August 19, 1976, a letter was forwarded by ODE assuring funding and suggesting that project activities commence but business practices are Oregon State University did not permit the hiring of staff until receipt of the grant award. This action delayed the accomplishment of certain project activities and Milestone 1 as scheduled.

(2) Milestone 1 (Process objective 1.0), completion of the instrumentation for data collection, was scheduled for attainment on November 1. This milestone was not met during the reporting period.

b. Major activities accomplished during the reporting period:

(1) Activity 1.1, hired staff.

(a) Ms. Jeane Dille was hired as a Graduate Research Assistant for the project.

(b) Mr. John Pence, an EPDA Fellow at Oregon State University, served an internship on the project during the Fall Term.

(c) Ms. Virginia Arnold, an EPDA Fellow at Oregon State University served as the liaison between the EPDA Program and the project. She voluntarily participated in the project.

(d) Ms. Wanda Cox, Administrative Assistant for the Vocational-Technical Education Unit, was assigned to the project at 0.42 FTE.

(2) Activity 1.2, form steering committee

(a) The steering committee was formed and convened on October 31.

(b) Special note should be made of the membership of Mr. Rod Juranek on the Steering Committee. Mr. Juranek was participating in the Oregon Career Education Leadership Development (Career Education Leadership Extern) Program during the year and agreed to serve as the liaison between the Extern Program and the project.

(3) Activities 1.3 and 1.4, develop and review evaluative criteria.

(a) An initial set of information elements (Attachment C) was identified from a search of the literature (Attachment D). The elements, which served as the basis for developing the evaluative criteria, were reviewed by the Steering Committee on October 31.

(b) Based on the critique by the Steering Committee, the information elements were revised and sent to the members of the Steering Committee. Steering Committee members were contacted by telephone to determine the adequacy of the revisions.

(4) Activity 1.5, develop instrumentation. Questions based on the information elements were developed. The questions were formatted into a recording instrument and interviewer's guide.

(5) Activities 2.7 and 2.8, prepare for and accomplish pilot test of instrumentation and procedures. This activity was completed.

c. Major problems encountered during the reporting period: The major problems encountered during this period were attributed to the delay in acquiring

notification of grant award (see paragraph 1a(1), above). Financial accounts for the project could not be established without the official grant award. The initial impact of the delay was felt in the organization of the project staff, including the accomplishment of necessary personnel actions. This, in turn, affected the project's potential to accomplish other tasks in the prescribed sequence in a timely manner. In order to ameliorate these problems, activities were accomplished concurrently rather than sequentially as specified in the approved proposal. Major activities affected by this change in strategy were concerned with the development and validation of instrumentation and procedures for data collection and with the preparation and accomplishment of the pilot test.

d. Fiscal:

(1) Actual expenditures during the reporting period. Because of the accounting practices at Oregon State University and the lateness in establishing an official account, the estimated expenditures based on records kept by the project's staff were $2,840.

(2) Predicted expenditures for the entire project. The budgeted amount of funds for the reporting period was $2,892. Therefore, there was an under-run of $52.00 for the reporting period. The difference did not affect the total expenditure for the project.

(3) Given below is the time commitment expected of staff members as on January 31, 1976. Also given is the actual time spent by staff members during that period. This information is divided

into staff time supported by funds from the Oregon Department of Education and staff time contributed by Oregon State University to the project.

Source of Funding for Positions	Type of Commitment (in hours)		
	Expected	Actual	Difference
ODE	303	288	-15
OSU	66	150	+84
Total	369	438	+69

2. DECEMBER 1, 1975 to JANUARY 30, 1976

a. Milestone(s) and Events:

(1) Milestone 1 (Process objective 1.0), completion of the instrumentation for data collection, was scheduled in the approved proposal for attainment on November 1; but it was achieved on December 12.

(2) Milestone 2 (Process objective 2.0), completion of data collection instrumentation and procedures for field testing, was scheduled for attainment on January 1, 1976. This milestone was met on January 16, 1976.

(3) Milestone 3 (Process objective 3.0), external review of instruments, procedures, and formats for the Handbook and Technical Report, was partially met, as scheduled, on January 23, 1976. Because of the number of man-hours needed to develop the entire methodology for deciding whether or not a practice would be appropriate for dissemination, only a third of the decision logic was developed for review and approval by the Steering Committee.

b. Major activities accomplished.

(1) Activities 1.5, 2.1, 2.2, 2.7, 2.8, 2.9, 3.1, and 3.2.

(a) Based on the information requirements specified in the Innovations Information List, information items were generated and formatted into an instrument. This initial instrument was subjected to simulated trials and revised based on the resulting evaluative information. A major finding of the simulated trials was the difficulty in recording information because of the number of pages in the instrument. The items were, therefore divided into questions that would elicit the necessary information. The questions that would elicit required information were

removed from the instrument and replaced by words or short phrases indicative of the necessary information.

(b) Questions removed from the instrument were recorded on note cards. Using the note cards, staff members were then trained to record on the Innovative Information List appropriate information contained in existing documents (such as a proposal, progress report, or final project report) and through interviews at field sites.

(c) With the assistance of the Oregon Department of Education's project officer, staff members identified ten of the seventy-two research and exemplary projects that would be used to pilot and field-test the instruments and procedures. Although these projects represented a variety of outcomes and outputs, they were conducted on field sites located in the Willamette Valley to facilitate the pilot and field tests. In a minor deviation from the procedures described in the approved proposal, three staff members independently reviewed the existing documentations on the first eight projects that would be reviewed. After comparing the information that they had recorded in the instrument, the three staff members then visited the field site to collect the remainder of the appropriate and available information by interviewing the person identified as the most appropriate contact for information about the site. One staff member asked the appropriate questions using the note cards, and the other two members recorded the elicited information. The instrument and procedures were then reviewed after each data collection sequence and revised as necessary prior

to the next sequence. The combined pilot and field tests were completed on January 16, 1976.

(d) With the assistance of the Oregon Department of Education's project officer, a letter was developed by the project staff to inform the chief executive officers of local educational agencies and community colleges, that conducted the seventy-two research and exemplary projects, of this review project and to ask for their assistance. The letter was printed by the Department of Education and sent by Oregon State University.

(2) Activity 2.6. The Oregon Department of Education's project officer, Mr. Eugene Vinarskai, and his secretary, Ms Dayna Hayhurst, cooperated fully with the project's staff to identify and acquire existing documentation on the seventy-two research and exemplary projects. Their prompt and generous assistance facilitated the progress of this review project. Existing documentation on all seventy-two research and exemplary projects was identified and made available to the project staff.

(3) Activities 3.3, 4.1, 4.2 and 4.3. By January 31, 1976, information contained in available documentation and through on-site interviews had been collected on a total of 28 projects. After the field test of the data-collection instruments and procedures, on-site interviews were conducted individually rather than by a team. The average amount of time needed for an interview was approximately 50 minutes. The preparation of the information for the Handbook and Technical Report was held in abeyance pending the completion of the decision-making procedures.

(4) Activities 2.3 and 2.4.

(a) Tentative formats for the Handbook and Technical Report were developed by the project staff and reviewed and approved by the Steering Committee. Two versions of the description of a promising practice that could appear in the Handbook were reviewed by the Steering Committee. Based on directions provided by the Steering Committee, the format was revised by the project staff and sent to the Steering Committee members for their review and approval. The Steering Committee also approved a tentative title for the Handbook. The tentative Promising Practices in Oregon Career and Vocational Education: Created in Oregon under the Auspices of Parts C and D of the Vocational Education Admendments of 1968 was approved.

(b) To facilitate the identification of promising practices, the "Innovation Selection Criteria" was developed and subjected to simulated trials by the project staff. A part of the decision-making procedures was developed to increase the reliability of deciding whether or not materials and processess produced during research and exemplary projects should be included in the Handbook as Promising Practices. The Steering Committee approved the "Innovation Selection Criteria" and directed that the entire decision logic be developed and tested.

(5) Activity 3.4. A meeting of the project's Steering Committe was held on January 23, 1976, at the Valley River Inn in Eugene.

c. Major problem(s) encountered during the reporting period: None.

d. Fiscal:

(1) Because of accounting practices at Oregon State University, the estimated expenditures based on record kept by the project staff was $7,875.00 as of January 31, 1976. The amount of funds budgeted for the period was $8,130.00. Therefore, there was an underrun of $255.00 (3.0%) as of January 31. The difference did not affect the total expenditure for the project.

(2) Given below is the time commitment expected of staff members as of January 31, 1976. Also given is the actual time spent by staff members during that period. This information is divided into staff time supported by funds from the Oregon Department of Education and staff time contributed by Oregon State University to the project.

Source of Funding for Position	Type of Commitment (in hours)		
	Expected	Actual	Difference
ODE	752.2	881	+128.8
OSU	137.6	235	+ 97.4
Total	889.8	1116	+226.2

3. FEBRUARY 1, 1976 to MARCH 31, 1976

a. Major activities accomplished.

(1) Activities 4.1 and 4.2. Project staff members completed the review of appropriate documentation on seventy-two research and exemplary projects available at Oregon State Department of Education. A project staff member then met with a representative of the local educational agency or community college or university that contracted for each of the projects. In many cases, additional documentation was acquired during these visits. With the exception of one project, data collection was completed on March 30, 1976.

(2) Activities 3.3 and 4.3

(a) The entire decision-making process was developed to increase the reliability of deciding whether or not materials and processes produced during research and exemplary projects were "promising practices." All practices identified during the data collection phase of this project were compared with the selection criteria in this manner.

(b) From the seventy-two research and exemplary projects, sixty-six practices were identified (it shoud be noted that a "project" was funded for one fiscal year, and one or more continuation projects were sometimes needed to produce the desired materials and/or procedures). Based on the decision-making process, 20 products and/or processes were identified as "promising practices", an additional 23 were recommended as promising practices but with reservation because of one or more deficiencies. The deficiencies were primarily a lack of valid

evidence on the practice's effect on students and/or the instrumental population (teachers, counselors, etc.) or the absence of a means, comprehensive and comprehendible documentation to transport the practice from the developing site to other sites. Twenty-three (23) processes and/or procedures were judged as inadequate for designation as promising practices because they did not meet two or more of the selection criteria.

(c) A description of each of the products and/or processes designated as "promising practice" or a "promising practice with reservation" was prepared for the handbook: Promising Practices in Oregon Career and Vocational Education. The descriptions of those designated "with reservation" were sent to members of the Steering Committee for review. A copy of the description of each promising practice with a publications release form was sent to the appropriate person at the field site for review, suggested revisions, and approval by an appropriate official of the agency.

(d) The handbook's cover, preface, introduction, section dividers, and glossary were developed and reviewed by the Steering Committee at its meeting on April 2th.

b. Major problem(s) encountered during the reporting period: None

c. Fiscal

(1) Because of the accounting practices at Oregon State University, the estimated expenditures based on records kept by the project's staff were $15,601.00 as of March 31, 1976. The amount of funds budgeted for the period was $15,600.00.

(2) Given below is the time commitment expected of staff members as of January 31, 1976. Also given is the actual time spent by staff members during that period. This information is divided into staff time supported by funds from the Oregon State Department of Education and staff time contributed by Oregon State University to the project.

Source of Funding for Positions	Amount of Commitment (in hours)		
	Expected	Actual	Difference
ODE	1515.9	1694.5	+178.6
OSU	240.8	298.0	+ 57.2
Total	1756.7	1992.5	+235.8

4. APRIL 1, 1976 to JUNE 30, 1976

a. Milestone(s) and Events:

(1) Process objective 4.2, completion of the Handbook and Technical Report, were completed during this reporting period. Two-hundred and fifty (250) copies of the Handbook were produced prior to the Spring Conference of the Oregon Council of Career and Vocational Administrators on April 29-30. A draft of the Technical Report was completed by June 3, 1976.

(2) The last Steering Committee meeting was held on April 2. The major item on the agenda was the review of the 23 practices designated " with reservation". It was decided that 20 of these practices would be included in the Handbook. Therefore, a total of 40 practices were reported in the Handbook. It was also decided that the deficiency for each of the practices included with reservation in the Handbook will be identified in the summary box of its description. Examples of descriptors are: "No evidence on student performance" and "User's handbook in process".

b. Major activities accomplished by the end of the project:

(1) The publication releases on all Promising Practices were acquired by the project's staff. On April 15, the camera-ready copy of the Handbook was forwarded to Oregon State University's duplication facilities for printing, collation, drilling, and wrapping in transparent covering. A copy of the Handbook was sent to the contact point for each practice with an appropriate transmittal letter. A copy was also sent to each member of the Steering Committee, and copies sent to the State Department of Education's project officer.

(2) The Handbook and the project's activities were presented during the Spring Conference of the Oregon Council of Career and Vocational Administrators at the Inn at Otter Crest on April 29. One-hundred copies of the Handbook were available for distribution at this time. A brief survey was administered at the end of the presentation.

(3) A draft of the Technical Report and an executive summary were prepared by the project's staff and sent to the Oregon Department of Education's project officer for review and comments. Because the Technical Report was significantly more comprehensive than initially conceived, it was not completed by April 30. It was completed on June 3, 1976. Only a limited number of copies of the Report were prepared because of the sensitive nature of the information contained in it and an early decision by all parties involved in the project that it would be made available only to ODE project staff.

(c) Major problem(s) encountered: None.

(d) Fiscal, See Section D, Budget Recapitulation.

C. SUMMARY AND CONCLUSIONS

SUMMARY

Seventy-two vocational research and exemplary projects, conducted during fiscal years 1970-75, were reviewed during this project. From these 72 projects, sixty-six potential practices were identified. For the purposes of this project, practices were defined as: products and/or processes that addressed a significant career development problem. A project was a funded enterprise that could require one or more years to produce a practice. In some cases, a practice could be produced through a research (Part C of P.L. 90-576) or exemplary (Part D) effort or a combination of research and exemplary projects or a combination of exemplary projects.

Of the sixty-six practices examined, forty were judged to meet a significant educational problem, to perform effectively, and to be transportable (see Table 1). Those forty practices were included in the Handbook. However, twenty of these were deficient in evidence on the effectiveness of the practice or means for facilitating transportability and were included in the Handbook with reservation. Therefore, twenty-six practices were judged insufficiently documented or lacking in evidence and were not included in the Handbook.

Figure 1 shows the locations of the institutions in which Promising Practices, i.e., those practices included in the Handbook, were developed and implemented.

As can be seen in Table 2, the largest number (12) of Practices included in the Handbook addressed two or more career development levels, e.g., career awareness, career exploration, etc. It should be noted that the largest number (19) of Practices was intended for the career exploration level. Although more Practices intended for career awareness, career preparation, career

* The number within the circle represents the number of Practices developed.

specilization, and more than one career development level were included than were excluded from the Handbook, a greater proportion (57.0 percent) of practices intended for career exploration level were excluded from rather than included in the Handbook.

Table 3 shows the educational level at which each of the Promising Practices intended to impact on. As can be expected, the largest number (13) Practices impacted or were intended to impact on students in more than one educational level. Three career exploration practices impacted on educational levels other than the junior high/middle school (Table 4). A variety of key words or descriptors was used by personnel of the vocational research and exemplary projects to describe their Promising Practices (see Table 5). The descriptors used most often were "staff development" (16), "articulation" (12), and "interdisciplinary" (16).

Fiscal Characteristics

An approximately equal number of practices was produced using research and training funds (Part C of P. L. 90-576) and exemplary (Part D) funds (see Table 6). However, a greater proportion of practices produced with exemplary funds was included in the Handbook than with research funds (73.1 percent vs. 30.8 percent, respectively.) It should be further noted that a relatively large number (14) of practices developed with exemplary funds was included in the Handbook with reservation, i.e., they were deficient in evidence of effectiveness or had limitations in their transportability.

The median level of funding for exemplary projects was $13,333 and for

Table 7 MEDIAN FUNDING LEVELS FOR PRACTICES INCLUDED IN HANDBOOK BY FUNDING SOURCE

Selection Category	Median Funding Level: Research	Exemplary
Practice Included in Handbook	$11,250	$11,250
Practice Included with Reservation	$10,000	$16,250
Practice Not Included in Handbook	$3,750	$12,500
Total	$5,357	$13,333

research projects was $5,357 (Table 7).* The median level of funding for exemplary practices included in the Handbook approximated the median level for exemplary practices excluded from the Handbook. However, the median funding level for research practices included in the Handbook was considerably higher than funding level of research practices exluded from the Handbook. Table 8 shows that a greater proportion of research-generated practices excluded from the Handbook was funded at $5,000 or less. Overall, practices developed with $5,000 or less were less likely to be included in the Handbook than were practices developed with more than that amount (Figure 2). It should be noted that the rate at which practices were included in the Handbook increased less rapidly above a funding level of $15,000 than between $5,001 and $15,000.

As expected, the more recently completed practices were more likely to be included in the Handbook than those funded during earlier fiscal years (Figure 3). During, fiscal year 1975, however, the proportion of practices included in the Handbook with reservation (42.9 percent) was relatively high as compared to prior fiscal years.

Thirty-five percent of the practices included in the Handbook were developed over two or more fiscal years (Table 9). Practices developed over two or more fiscal years were also more likely to be included in the Handbook than those funded for only one fiscal year (77.8 percent and 54.2 percent, respectively).

---

*The amount of funds expended by each project during each funding year was corrected for inflation. The correction factors used for each fiscal year were as follows: 1970 - 1.449; 1971 - 1.399; 1972 - 1.359; 1973 - 1.281; 1974 - 1.135; and 1975 - 1.000. These correction factors were based on the consumer price indices reported in the Handbook of Basic Economic Statistics (Washington, D.C.: Bureau of Economic Statistics, Inc., January 1976).

Table 8 NUMBER OF PRACTICES AT EACH FUNDING LEVEL BY FUNDING SOURCE AND BY WHETHER OR NOT THE PRACTICES WERE INCLUDED IN THE HANDBOOK

KEY

Practices not Included in Handbook

Practices Included in Handbook

Further, it appears that practices developed over two or more years were more likely to be included in the Handbook without reservation than those funded during only one fiscal year.

The largest proportion (70 percent) of practices included in the Handbook was developed under contracts with public school districts (Table 10). Only fifteen percent of the practices included in the Handbook were developed under contracts with community colleges in Oregon. However, practices developed under contracts with public school and intermediate education districts were more likely to be included in the Handbook than practices developed by other agencies (Table 11).

Development, Evaluation, and Documentation of Practices

The adequacy of the methodologies used to develop and evaluate practices varied widely among projects. However, the methodologies tended to be generally less than adequate. Table 12 shows the levels at which acceptable evidence was present to determine whether or not practices were effective, that is, accomplished what they intended to do. Nearly all projects implicitly or explicitly intended to affect student behaviors; but only a relatively few could provide evidence that students ultimately benefitted from the practices that were developed. Of the seventeen practices included in the Handbook that had evaluative data on student achievement, nearly all had only partial evidence of desired outcomes. Furthermore, for 23.1 percent of the practices, the only evidence on effectiveness was the degree to which the developmental methodology used appeared to be adequate. The actual effectiveness of these practices is speculative because a sound developmental methodology only enhances the extent to which a resulting practice will be effective. Although sound developmental methodology does not guarantee the effectiveness of a resulting practice.

It was assumed that a practice was more transportable to another environment if its documentation was complete. That is, there appeared to be a relationship between the availability of a practice or its description in hard copy and the degree to which another institution or agency could adopt it, most likely after adapting the practice to its own environment. However, the degree to which practices were communicable through means other than word of mouth varied among projects. By definition, all practices included in the Handbook are communicable (Table 13). Most of these were adequately documented in addition to having individuals willing and able to discuss the practices with interested persons. However, a standardized means to disseminate practices is not available.

Table 12 NUMBER AND PERCENTAGE OF PRACTICES BY LEVEL OF ACCEPTABLE EVIDENCE ON EFFECTIVENESS FOR INCLUSION IN THE HANDBOOK

Documentation on the development of practices included proposals, quarterly or interim reports, and final reports. However, the existence of documentation and the adequacy of available documentation varied markedly among practices. Although staff members of the Oregon Department of Education were more than willing to assist this project's staff to acquire needed documentation, a large amount of information had to be collected during field visitations.

Although not conclusive, it appears that the sixty-six practices could be characterized in other ways. A majority of the staff members interviewed indicated that staff commitment, whether it involved the availability of staff time, teachers' attitudes and/or administrators' attitudes, was a key condition to the success or failure of a developmental effort. From another perspective, practices that had some degree of staff involvement as a part of the developmental effort and/or in the form of staff development tended to be designated "promising" more often than those that did not.

The first distribution of the Handbook was made to sixty-nine participants who attended the symposium on the review project at the Spring conference of the Oregon Council of Career and Vocational Administrators. Approximately thirty Externs and Interns in the Oregon Career and Vocational Education Leadership Development Program and Oregon State University's Education Professions Development Act Program also attended the symposium but received copies of the Handbook after the conference. All participants were asked to critique the Handbook, although they had only a minimum amount of time to study the Handbook. Seventy-two persons returned a copy of the critique form (Appendix P). Almost all respondents indicated a positive attitude toward the Handbook. Nearly all respondents felt that the Handbook was adequate.

CONCLUSIONS

The following are conclusions pertinent to the funding of vocational research and exemplary projects. They are based on the findings previously described and on the reflections by project staff members as a result of experiences during the conduct of this project.

1. Projects were generally conducted with a high degree of professionalism. However, greater attention needed to be paid to the planning, implementation, and management of projects and the designing and implementation of project and program evaluations.

2. Most practices addressed career development behaviors at the educational level initially concerned with them, e.g., career awareness during elementary grades, exploration at middle or junior high school grades. Only a few practices addressed career development behaviors at a level higher than the initial one.

3. Projects funded at $5,000 through $15,000 appeared to provide the optimum results. Projects funded at less than $5,000 tended to be less that successful. Funding at more than $15,000 did not markedly improve the potential of a project to produce a Promising Practice. Furthermore, projects conducted by public school districts and intermediate educational districts tended to be more successful than those conducted by other types of agencies.

4. More practices would have been designated as "Promising" if means were available for communicating them to others. Inadequate documentation and unavailability of material were primary deterrents to the communication of practices.

5. The Handbook is being viewed positively by practitioners. However, its effectiveness should be further studied.

E. RECOMMENDATIONS

Based upon the findings of the review project, discussed at length in the Technical Report, the following recommendations are offered:

1. Encourage active participation of potential users in the planning and/or development of projects' processes and materials.
2. Incorporate third-party evaluation as early as possible and as an integral part of the project's planning stage as well as the developmental stage.
3. Provide technical assistance for practitioners wishing to submit proposals to include all aspects of writing, implementing, documenting and evaluating funded proposals.
4. Provide technical assistance to potential grantees on product and process evaluations and on the importance of securing valid evidence on student and/or staff performance.
5. Establish clearly defined criteria for the selection and awarding of funds.
6. Maximize the use of steering and/or advisory committees to provide guidance for and accomplish validations of project efforts.
7. Provide technical assistance to grantees in the following areas: using third-party evaluators, conducting self assessments, and planning and managing programmatci efforts.
8. Develop means by which materials produced by completed projects can be distributed to potential adopters.
9. Develop means by which revisions to Promising Practices can be included in the descriptions in the Handbook.
10. Conduct an annual review of career and vocational research and exemplary projects; update the Handbook descriptions as well as the "see also" or cross-references, glossary, and index.

E. RECOMMENDATIONS (continued)

11. Develop means by which outdated Promising Practices can be identified and removed from the Handbook.

TITLE: CAREER NEEDS ASSESSMENT FOR MERGED AREA IX.

PERSONAL AUTHOR: SCHULTZ, RICHARD

DESCRIPTOR: *CAREER EDUCATION; *NEEDS ASSESSMENT; SCHOOL SURVEYS; COMMUNITY SURVEYS; *EDUCATIONAL NEEDS; SCHOOL DISTRICTS; TABLES (DATA); QUESTIONNAIRES; FACILITY INVENTORY; *EDUCATIONAL RESOURCES

EDRS PRICE: MF AND HC AVAILABILITY WILL BE ANNOUNCED IN VOL. 10, NO. 2.

DESCRIPTIVE NOTE: 148P.

ABSTRACT: THIS STUDY SOUGHT TO DETERMINE STUDENT CAREER EDUCATION NEEDS IN IOWA MERGED AREA IX AND TO IDENTIFY EXISTING RESOURCES FOR RECOMMENDING ALTERNATE METHODS OF CREATING AND FINANCING A COORDINATED CAREER EDUCATION PROGRAM. DATA WERE COLLECTED FROM THE SCHOOL DISTRICTS BY VISITATIONS, CAREER CLUSTER CHECKLISTS, MAILED INTERVIEW FORMS, AND INTERVIEWS WITH EDUCATIONAL PERSONNEL AND STUDENTS. OTHER SOURCES OF INFORMATION WERE SOCIAL SERVICES AGENCIES, BUSINESS, INDUSTRY, LABOR, POSTSECONDARY INSTITUTIONS, AND MANPOWER PROJECTIONS. BRIEF INDIVIDUAL DISTRICT PROFILES BASED ON THE COLLECTED DATA APPEAR IN THE REPORT. DATA COMPILED FROM EACH DISTRICT ARE REPORTED IN THE FOLLOWING FOUR CATEGORIES: (1) CAREER EDUCATION ATTITUDE SURVEY--TEACHERS, NON-TEACHERS, STUDENTS, AND CITIZENS; (2) SURVEY OF HELPING RELATIONSHIPS; (3) INTERVIEW FORMAT; AND (4) CAREER CLUSTER CHECKLIST. THE DATA ARE PRESENTED ON THE BASIS OF FOUR PROPOSED CAREER CENTERS. APPENDIXES CONTAIN MERGED AREA IX'S CAREER EDUCATION DEFINITIONS; MODEL FOR CAREER DEVELOPMENT; POPULATION TRENDS; ENROLLMENT PROJECTIONS; SCHOOL DISTRICT DATA FORMS; SOCIAL SERVICE AGENCIES DATA; BUSINESS, INDUSTRY, AND LABOR DATA; AND COMMITTEE MEMBERSHIP LISTS. PROLOGUE

The infra materials represent the work product of a local-state-federal project. Whenever data is missing or not listed, it is due to either an insufficient or no response to the item. Two documents were published because they serve two totally different purposes: how-to and examples as opposed to research and analysis.

The many educators, professionals and support staff who contributed to this project's completion are sincerely thanked. More importantly, I thank my wife, Linda, for enduring the long hours and piles of paper that are indigenous to a research project of this sort.

INTRODUCTION

Career Education was initially used as an educational concept by Dr. Sidney Marland in 1970. At that time, Dr. Marland established a "paper priority" for public education in the United States. From that initial statement a total transition was begun in the area of public education.

Each of the fourteen merged area school districts has now either begun or completed a Career Needs Assessment Project. Utilizing federal-state-local funds, the EASTERN IOWA COMMUNITY COLLEGE DISTRICT (EICCD or Merged Area IX) has functioned as the contracting agent to conduct the project in this district. By obtaining the cooperation of the local public school districts, social agencies and local business-industry-labor a comprehensive scope of the career education needs for Merged Area IX was obtained. The resultant Master Plan reflects the Career Education Needs for the entire district.

Merged Area IX contains all of Scott, Clinton, and Muscatine Counties plus part of Louisa, Johnson, Jackson, and Dubuque Counties. Its total area is 2,466 square miles with a population of 265,333 people. Twenty-two of the local public school districts were involved in the project. Social Service Agencies which actively function in the district were selected for inclusion. EICCD has three colleges under its dominion. Each of these was included; a total of 15,132 students enrolled at the three colleges: 12,046 in Adult Education classes, 1,849 in Career Programs, and 1,237 in College Parallel programs.

The primary intent of this project was to determine constituent needs, identify existing resources, and recommend alternate methods

of both creating and financing Merged Area IX's progress towards a coordinated and integrated career education program.

WHY?

Theories abound concerning the present emphasis on career education. One source argues the concept was a reaction to over-emphasis upon technology since the sputnik era with the new emphasis upon individual students and their interests. The final report of Merged Area XII appears to argue that the entire concept evolved naturally from legislative enactments. Hoyt details a public mandate to reform American education so it will be more relevant-accountable to society's expectations.

For this project, three separate, yet convergent areas were identified as partial origins of the concept of career education as it exists today.

1) Previous legislative mandates for changes in education have dealt with isolated segments of that field. With the recent U. S. Office of Education Position Paper dealing with Career Education, the intent to totally revamp public school education becomes evident. The Department of Public Instruction's underwriting of career needs assessments for all fourteen Merged Areas in Iowa evidences the state's commitment to this concept (65th General Assembly, SF 126; 1974 amendments to the Iowa Code, 257.25 Sec. 11).

2) In the existing economy, it becomes even more imperative for education to be able to justify and account for its expenditures. Career Education, by assisting the development of the students' interests and attitudes and by preparing the student for the world of work, would serve as a more objective means of accountability (A national policy on Career Education; National Advisory Council on Vocational Education; September, 1974).

3) P. A. R. C. verus Pennsylvania, Rodriguez verus San Antonio, and related judicial decisions reemphasized the individual's federal right to a public school education. Career Education serves as a vehicle for helping each individual

CAREER EDUCATION: OPERATIONAL DEFINITIONS AND MODEL

Merged Area IX attempted to synthesize a definition of career education that was as broad as possible. Three organizational definitions were identified as offering an initial framework within which more specific portions of the career education concept could be isolated (November, 1974, An Introduction to Career Education United States Office of Education Policy Paper, September, 1974; A National Policy on Career Education, National Advisory Council on Vocational Education; and 1973, Models for Career Public Instruction in Iowa: Career Development Model and Explanation, Department of Public Instruction, Des Moines, Iowa).

During the assessment process six points were identified as being critical to the development of a comprehensive definition of career education. It was not presumed that these points were the only ones of importance. Rather, it was determined that without recognizing each of them, and including each of them in any planning, a program would be woefully deficient. They represented an irreducable minimum in regard to identifying the essential component elements of a comprehensive definition of career education.

The third part of Merged Area IX's operational definition of career education involved the process of adapting each of the five stages of career education as established by the "Iowa Project" (Models for Career Education in Iowa, "Career Development Model and Explanation", Iowa State University - Career Education Division, Department of Public Instruction, 1973). Rather than adopt the lengthy definitions used by the "Iowa Project", Merged Area IX attempted to summarize them. An additional modification was to insert

the neutral word "per" rather than the sexist use of the words "his" or "her".

In an effort to remain current, Merged Area IX did adopt the more recent "Model for Career Development". Rather than using the original dual-spiral model, Merged Area IX used the dual-trapezoid model (Models for Career Education in Iowa, "Career Development Model and Explanation", Iowa State University - Career Education Division, Department of Public Instruction, 1973).

Both Merged Area IX's Career Education Definitions and Model for Career Development are in the appendix. The former is on page C-1; the latter, on page C-2.

POPULATION TRENDS

Merged Area IX - Communities

From 1960 to 1972 Iowa has experienced a greater percentage decrease in its birth rate than the United States as a whole (Update, Figures 2 and 3). The actual population in Iowa decreased from 1950 to 1970 primarily due to death and migration (Update, Table 2). From 1960 to 1973 the percentage of natural increase in Iowa declined due to a decrease in births (Update, Table 3). The apparent out migration of Iowa's young adults from 1960 to 1970 resulted in a decrease in the population age nine and below (Update, Table 2). During that same decade, Merged Area IX had a percentage decrease in the population five years old or less (Update, Table 5).

Merged Area IX is one of the major industrial complexes in Iowa. As a result, the population trends in the state are less applicable to this merged area. During the 1960 to 1970 period, each county in Merged Area IX increased its population (Update, Figure 1). Through 1972, each county had additional percentage increases; Jackson the highest, Louisa the most consistent, and Scott the largest decline in its percentage increase (Update, Table 1).

Caution must be exercised in generalizing this atypical growth. Each of the five major counties in the merged area had a decrease in its birthrate from 1955 to 1971 (Update, Table 4). In 1972, each year of children below age five was smaller than the year just above it (Update, Table 6). The number increase, since it is not due to birth, is coming from in-migration of families with preschool age children. The major in-migration is of adults seeking employment in the local

industry. This movement is reflected in Merged Area IX's population increase. The adults represent an apparently accessible group for educational purposes.

Additional evidence of Merged Area IX's growth, and a comparison with Iowa's growth, is provided by Appendix 3. That appendix has the merged area divided into counties and subdivided into civil divisions and the balance of the county. With the exceptions of the Cedar, Louisa and Dubuque portions of Merged Area IX, the counties reveal a pattern of growth. The Eldridge and Bettendorf areas of Scott county and Camanche in Clinton county all represent a percentage increase greater than fifty percent (50%) in 1960 and 1970. Each of these communities is a bedroom district to the existing labor complex. Since 1940, Merged Area IX has at least doubled the state's percentage increase in population.

Merged Area IX - Local Educational Agencies

The mean survival ratio technique was used to project enrollments for each district in Merged Area IX (A Master Plan for Implementation of Career Education in Area XII, page IV-F.1 and Planning Study to Determine the Career Education Needs for Merged Area V, page 8). All enrollment and dropout data was obtained from the Secretary's Annual Report 1969-70 through 1973-74. These projections are included in Appendix 4. They are arranged according to the proposed career centers recommended by the project's steering committee. The locations were selected on the basis of three criteria:

1) within thirty miles of each participating school district

2) participating districts, collectively, have an available population of at least 500 prospective students (seniors)

3) the availability of work experience-release stations within the immediate vicinity of the proposed career center

The enrollment projections should be interpreted and utilized with the following parameters:

1) they are only projections, not prophecies; their best use is for planning with annual revisions

2) the "years-MGD" (pre school) is excessively skewed due to the reporting of that data on a two year cycle; thus, the decimal actually represents change over a two year period

3) school district data is reported on a descending year basis to provide data for each grade level

4) the drop that occurs between kindergarten and first grade is probably due to a shift from public kindergarten to parochial primary school

5) the Center data is omitted on alternate years to try to compensate for the skewness caused by the reporting on an alternate year basis

6) multiple errors are likely due to the MGD, being based on enrollment gain in prior years, being applied as a constant to predict future changes in enrollment

7) review of past enrollment yields increases almost annually, but, this tendency is very unlikely to continue, especially at the rates projected

As mentioned, preschool appears to be increasing; yet, primarily due to in migration. The general trend in grades K-5 is towards a decrease in population. This may be partially due to the larger percentage of students attending parochial primary school (K-3) when compared to the percentage enrolled in public school grades K-6

(Update, Table 7). Grades 6-8 generally show an increase, the last of the present natural population increase. In Iowa the apparent separation point was at seventh grade, while Merged Area IX did show some larger classes into fifth grade (Update, Tables 7 and 8). Following these classes through secondary school, 1980 looms as a new era representing nongrowth. The decrease of students in grades 9-12 is disheartening. The most chronic attrition on a state level is in grades 11, 10 and 12 respectively (Update, Table 9). Iowa lost students during 1972 and 1973 for three reasons: out-migration, birth decline, and drop-outs (Update, Figure 10). While the Delmar Community School District retains ninty-nine percent (99%) of its senior class and graduates ninty-nine percent (99%) of those eligible; Davenport, Muscatine and Louisa-Muscatine lose an average of fourteen percent (14%) of the senior class; and Pleasant Valley, Muscatine and Columbus do not graduate an average of nine percent (9%) of the eligible students.

Merged Area IX - Post-Secondary Education

Both Merged Area IX and Iowa have experienced a smaller percentage and a smaller number of high school graduates entering post secondary institutions since 1969 (Update, Table 10). The attendance patterns of Merged Area IX's graduates has had a more severe decrease at two year institutions than either the same decrease on a statewide level or their decrease at four year institutions (Update, Table 10). Approximately forty-two percent (42%) of Merged Area IX's high school graduates were enrolled in institutions of higher education one year after graduation, with twelve percent (12%) of that group attending two year institutions (Update, Figure 12).

Iowa's 1965 to 1973 enrollment patterns reveal changes. Attendance

has decreased by thirteen and nine tenths percent (13.9%) at private colleges and universities while increasing one and seven tenths percent (1.7%) at state universities. Area school Arts and Sciences and Vocational-Technical programs have increased six tenths percent (.6%) and eleven and six tenths percent (11.6%) respectively (Update, Table 14). Private college administrators identify the following as some of the factors contributing to a decline in their student enrollment:

> the teacher "surplus" which has decreased enrollment in those programs which were typically entered by a large percentage of private college graduates
>
> spiraling tuition costs at private institutions
>
> the impact of low-cost two year college programs provided by area community colleges
>
> disenchantment with liberal arts education based upon the perception that it has very little relevance to society
>
> the increasing emphasis on vocational-technical training as an alternate to a college education (Des Moines Register, April 1, 1973).

During the same time period, programs which students entered have also changed. Vocational-Technical increased, particularly the full time enrollment. Full time Arts and Sciences decreased. Female increased in all areas, particularly in Vocational-Technical. Although male Vocational-Technical increased, they have declined since 1970 in Arts and Sciences (Update, Table 15). Appendix 5 shows Merged Area IX has had a large decrease in full time enrollment, but even more significant increases in part time enrollment as of October, 1974.

From 1970 to 1973 particular characteristics of the student population in Iowa's area colleges changed. These changes are revised for Merged Area IX as of September, 1974 in Appendix 6.

1) The percentage of students returning to programs or transferring back increased while students new to higher education decreased (39.6% increased to 50.4% while 60.4% decreased to 49.6% (Update, Figure 26).

2) Both the percentage of students transferring from other colleges and the percentage returning to new programs at the same college increased (3.9% transfers increased to 7.7% and 3.2% new programs increased to 5.4%) (Update, Figure 26).

3) More students were over 22 years of age and, partially due to this phenomena, fewer were single (81.4% typical age range students decreased to 68.1% and 80.6% single decreased to 68.1%) (Update, Figures 27 and 28).

4) While the percentage of veterans increased, the percentage of noncaucasians decreased (14.7% veterans increased to 22.2% while 6.3% noncaucasians decreased to 4.3%) (Update, Figures 29 and 25).

5) Less influence on the student's decision to enroll was provided by parents and high school counselors while admissions counselors and other students exerted more influence (9.1% parental and 42.4% high school counselor influence decreased to 6.7% and 23.7% respectively while 26.4% other student and 7.6% admissions counselor influence increased to 30.4% and 20.2% respectively) (Update, Figure 30).

6) The percentage of students' parents that had not completed high school and grade school decreased while mothers generally completed more education than fathers (fathers 19.8% nonhigh school graduation and 18.7% grade school or less decreased to 17.1% and 18.3% respectively while mothers 15% nonhigh school and 10.1% grade school or less decreased to 12.4% and 9.7% respectively) (Update, Figures 32 and 33).

Partially due to the older age of the students, their part time attendance, and their increased tendency to be employed, fewer students receive financial assistance from their parents. In 1973 there were forty-seven and seven tenths percent (47.7%) of Iowa's area school

students paying their own expenses while in 1974 fifty-eight and eight tenths percent (58.8%) of Merged Area IX's students declared themselves independent of their parents support and seventy-seven and one tenth percent (77.1%) received less than twenty-five percent (25%) of their income from parents (Student Information Questionnaire, 1974).

In Iowa the head count enrollment for credit courses in area schools has increased since their inception in 1966 (Update, Table 12). Merged Area IX is more likely to decrease its credit enrollment in the Fall/Winter quarters and increase in the Spring/Summer quarters (Update, Table 11). Adult education programs typically have the opposite fluctuation. By 1970 fifty-six and seven tenths percent (56.7%) of the population over twenty-five years of age had completed high school (Update, Table 20). Combining this fact with the Iowa Employment Security Commission's 1975 projected increase for all areas of white collar labor and decreases in farming and general labor, it is evident that the community colleges can continue to develop and offer post-secondary training and preparatory programs to a receptive population of potential students.

CONSTRAINTS

Two patterns of movement by people in Merged Area IX exist as limitations on the development of any program. First, since 1960 a literal flight from rural areas has occurred in both the United States and Iowa. The number of farms has decreased, the average size has increased, and the total amount of land being farmed has remained constant. More than seventy percent (70%) of America now lives in urban areas (Update, Table 22). Secondly, each county in Merged Area IX has a net loss of employees when out migration of residents is compared to in-migration of nonresidents (Commuting Patterns in Iowa, "Net Commutation of Iowa Counties", pp. 71-72). As these two phenomena occur, some flight from large urban areas to smaller towns or suburbs (while retaining the same employment within the city), increased specialization requiring further travel to obtain suitable employment, and the tendency of some unemployed farm laborers to remain in rural areas while working in the city all serve to further complicate efforts to implement programs (Commuting Patterns in Iowa, "Introduction"). With such extensive temporal movement, it is quite difficult to identify a stable population which programs could be developed to assist. Over seventeen percent (17%) of Davenport's work force alone is employed in Illinois while ninety-five percent (95%) of Rock Island's 5,130 commuters to Iowa are employed in Scott County (Commuting Patterns in Iowa, "Analysis of Commuting Patterns in Iowa", p. 2). Appendix 7 represents inter-county commuting patterns as of the 1970 census.

Although three community colleges do serve Merged Area IX, they are literally divided in half by the Mississippi River. At this point,

some cooperative ventures are occurring between Scott Community College and Black Hawk College that do traverse the state border. These mutually beneficial exchanges should be encouraged.

In 1971, unemployment rates varied in each county. While these rates have certainly changed due to the present economic situation, it is plausible that their ratio in each county has remained relatively stable. If this is true, Jackson and Louisa would have a higher unemployment rate than Scott or Muscatine. Clinton would be placed between Louisa and Scott (Update, Figure 39). This same hierarchy was validated by 1971 work force unemployment rates (Update, Table 23). The variance in rates of unemployed should suggest alternate programming for the population of that county. Lower unemployment areas would probably be more receptive to leisure time or general interest programs while higher unemployment areas should be more interested in retraining skill programs.

Merged Area IX has a relatively split low income population. As of 1973, Scott County had between six and nine percent (6% and 9%) while Jackson County had eighteen to twenty-one percent (18% to 21%). Clinton, Louisa and Muscatine Counties had nine to twelve percent (9% to 12%) (Update, Figure 40). These differences, although not as dramatic as the unemployment rates, would also very likely suggest alternate programming to meet needs of the different populations. From 1970 to 1973, only Scott and Muscatine counties had a decrease in the number of families designated as impovershed (Update, Table 25). These are the same two counties that had the lowest unemployment rate in 1971.

Perhaps the most discouraging constraint was identified by the project's Social Agencies Committee. Their major client need was for

an acceptance of handicapped or disadvantaged people by the communities. Since 1964's Civil Rights Act, blatant racial discrimination has declined; but, this more sophisticated bigotry still exists. Without accepting each person as an entity capable of contributing to society, career education will remain only educational jargon.

PROCEDURE

School District Data

Merged Area IX was finally authorized to begin its Career Needs Assessment Project in November, 1975. The decision to promptly visit the school districts was based upon two factors:

1) The project director would obtain an overview of the entire merged area and derive information about the structure-organization of each school district.

2) Visibility for the project, and some evidence of the state department of education's willingness to fund career related projects, would be readily achieved.

One apparent disadvantage was the insufficient amount of preparatory time for the director prior to making the initial visit. What became readily evident was the school districts' interest in having a career education specialist-consultant to assist each district with its program. Although the project was not originally directed toward this concern, it has evolved into an attempt to provide the assistance originally requested.

During the initial visit, three sets of data were either obtained or solicited. The Facility Assessment Inventory was completed by the director after inquiries of the personnel. This document was designed solely to yield an overview of the districts offerings, resources utilized, and comments in regard to career education. The request for both an equipment and resources list and an identification of faculty and profile of space utilization was attempted. Although these items were requested, few of the districts provided all of the data. The rationale underlying the requests was the need to identify what

resources were available and the extent of their use. If these requests serve as an approach for the school districts to initiate their needs assessment by analyzing their present functioning, then, although unavailable for the project, the original rationale for obtaining the data will be realized.

Approximately one week after the initial two hour visitation, a follow up letter was mailed. A career cluster checklist was sent with the letter. This form provided two types of information:

1) the district's perceptions of its curricular offerings when placed in a career education framework

2) some insight into the district's comprehension of career education

In addition, it presented multiple occupations within the clusters which could be readily incorporated into a career awareness or accomodation program.

Upon receipt of the completed checklist, the interview format was mailed. This instrument was designed to provide the information that would be helpful in obtaining a more detailed view of the district's career education efforts. Frequently, responses in the Interview Format served as a stimulus for questions during the evaluation visitation.

After all data was accounted for, the one day evaluation visitation was arranged and verified. During this visit, the career education questionnaires were distributed, teaching and nonteaching personnel were visited, and students were interviewed. This was the final personal contact with each school district, so the major emphasis was upon responding to concerns of the district's personnel and completing the data gathering process.

Each of the instruments used for data gathering are listed in Appendix B.

Social Service Agencies Data

A detailed list of social service personnel was developed for the acquisition of this data. After verifying the participants willingness to contribute, a checklist of client needs was mailed with the request for identification of any additional omitted needs. After receipt of the completed forms, a committee meeting was held to establish priorities for the needs.

Once the social service agency committee had established their priority needs and articulated their concerns, these items were incorporated into the masterplan. The principal value of coordinated efforts between educational and social service agencies would be the latter's opportunity to identify areas needing greater emphasis by the former. If the school districts can refine their programs through a proactive approach, then the social service agencies should have less remedial-reactive work to do. In addition, improved communication would serve to create an atmosphere of cooperative exchange.

The Client Needs Checklist and Composite Priorities are listed in Appendix 9.

Business-Industry-Labor Data

The original intent was to obtain data on openings in training programs, projections of areas to be developed and to generally orient this population to the concept of career education. The decision to operate through an intermediary was made; yet the coordination required to develop a committee was never achieved. The inability to further develop this dimension of the project can be attributed to three principal areas:

1) the instrument used was inapporpriate for use

2) the value to be derived from participation is, at this time, not readily evident to this population

3) reluctance to predict for all of Merged Area IX based upon a random sampling was a primary concern of the potential committee members

As a result, the majority of the project's data was derived both from local district assessments and from CENIS. It is recommended that local districts undertake an assessment of their particular environment using the instrument presented on page A-361. This provides local industry data and develops an additional base of support for career education in curriculum. Appendix 10 is the introduction and rationale prepared for business-industry-labor.

Post Secondary Data

The major thrust in this area was to improve the existing opportunity for individuals to enter the three community colleges of Merged Area IX. Less importance was assigned to working with two year transfer schools because local school districts frequently mentioned the recruiting visits made by liberal arts institutions and these institutions do not normally contact the sixty-five to forty percent of the graduating class that will leave high school without employable skills and without seeking further training or education.

A list of openings in career programs was developed for the February 1975 quarter. The most evident area of need was for the inclusion of career education as part of the preparation of educators on either a training or an in-service basis.

As institutions elect to develop additional programs, they should make reference to the priority occupations listed in Appendix 11.

MANPOWER PROJECTIONS

CENIS

At the outset of this project, it was anticipated that CENIS-1975 would be available for inclusion. It was not. Any projections, conclusions, or recommendations contained in this section of the project must be tempered by changes from CENIS-1973, which was used, and CENIS-1975.

Two sets of data were derived from the CENIS responses. In January, 1975 the Department of Public Instruction released an updated document entitled "Iowa Priority Training Area Rankings". It is enclosed in Appendix 11.1. Considering manpower needs, student availability and program effectiveness the department exercised some prestidigitation that resulted in a hierarchical organization. In effect, they have established a list identifying which career programs will be favorably considered and which will not. These programs' priorities were based upon state projections, and do NOT exclude a district requesting funding for a program that is needed in that locality, but is low on the state's list.

The second set of data is a reorganization of the original CENIS data. It is entitled "Priority Employment Needs by Cluster". Each of the fifteen clusters is identified with appropriate occupations listed under the cluster. No occupation would fit under the Marine Science cluster and several other clusters had only one or two occupations to be listed. This appears to be a weakness in the CENIS-1973 list of occupations. Five horizontal headings were used:

a. Current employment - shows the number of positions presently being occupied in a particular occupation

b. labor demand - shows the anticipated number of positions to be filled by 1975

c. total labor supply - shows the number of individuals presently prepared or preparing to enter the occupation

d. primary student interest - shows the number of students who are interested in preparing to enter an identified occupation

The vertical categories were:

I. EXCESS NEEDS - any positive net demand that exceeds the student interest (Note: in a few instances, an occupation was listed in this category rather than Excess Interest because of a positive net demand in Merged Area IX)

II. EXCESS INTEREST - occupations that have student interest exceeding the net demand

III. EXCESS SUPPLY - occupations with a negative net demand (Note: in some instances, an occupation was listed in this category because of a negative net demand in Merged Area IX although a positive demand existed in the state)

IV. NO RESPONSE - occupations having received no response under the primary student interest heading in Merged Area IX

Each heading is separated into both Merged Area IX and Iowa listings of data. The completed document is in Appendix II.2.

The department's priority rankings are useful for advisement of students, concerning employment prospects in Iowa, or as a basis of comparing local district program priorities to the state's priorities. The cluster organization should more directly identify priorities of Merged Area IX and can be used as a list of cluster-occupations for inclusion in a local district's curriculum.

It would be extremely inappropriate, perhaps even unethical, to track students into these programs based solely on the apparent future availability of a position. At the same time, it is a serious act of

nonfeasance to omit providing students with these employment projections or to fail to implement programs designed to prepare students for these anticipated employment needs. The crux is to provide relevant programs and encourage students to explore and prepare based upon their discretion and interest.

IOWA EMPLOYMENT SECURITY COMMISSION (IESC)

In the present economic situation, most of the employment predictions must be interpreted with a realistic skepticism. The conditions placed upon the accuracy of projections by either the United States Department of Labor or the Iowa Employment Security Commission has been transgressed (Manpower Needs in Iowa by Occupation 1971-1975, "Forward"). However, once economic recovery is initiated, and with some decreased accuracy even now, the projections may be useful in identifying trends. In Iowa, during the period ending in 1975, the most rapid increase is anticipated in professional, technical and related occupations. Service occupations will be next. Clerical and related occupations will also increase; but laborers, farmers, and farm workers are expected to decline (Manpower Needs in Iowa by Occupation 1971-1975, p. 4).

Contrasted to the growth rates, the number of anticipated new positions yields a slightly different order. Clerical and related is expected to have the greatest number of new positions. Service occupations are second. Professional, technical, and related will also have a number of new positions (Manpower Needs in Iowa by Occupation 1971-1975, p. 5). These trends probably have some validity at this time.

In addition to labor demand, labor supply projections have been made. Clerical and sales occupations have the largest supply of avail-

able workers. These positions frequently represent entry or re-entry positions. Service occupations are next. While they are also typically entry level positions, an excessive turnover rate tends to produce more qualified potential employees than positions available. If practicums could be introduced to permit reality testing by the individual of per perceptions about the work, then the high turnover rate might be reduced. The third largest available supply of workers is classified miscellaneous occupations: tractor, trailer, industrial, heavy and light truck drivers; service station attendants; and packagers. Structural workers, processing, benchwork, agriculture, machine trades, managerial, technical, and professional are the least available supply of workers according to the IESC.

VISITATIONS

Ignorance breeds frustration which creates hostility. This is the cycle occurring in Merged Area IX. The districts are inundated with materials from the Iowa Project; yet they have not been able to identify the connecting thread between the various documents. Some personnel verbalized that even the State Department of Public Instruction could not agree on what career education is since they keep sending out "new" and different documents.

At this point, elementary school personnel appear more willing to incorporate career education into their curriculum. The junior and senior high staff members are antagonistic towards the idea of changing a course they were taught to teach. Even the counselors and administrators were frequently without consistent and appropriate ideas for implementing career education. Frequently, personnel visited were quite chagrin that the director was performing an assessment and would not be functioning as a permanent consultant.

The consensus opinion was that it would cost more money, require outside assistance, and be relatively difficult to develop career education within the districts. The first two items speak primarily to the impotent feeling that prevails within the districts when assigned an "additional" obligation. The difficulty could come from the afore mentioned ignorance, the antagonism of secondary staff, or the incorrect belief that career education must be totally integrated into the district immediately.

Following are brief Individual District Profiles. These were written based upon both the Director's contact with and visitations to the district and the responses and comments that were elicited.

CAMANCHE COMMUNITY SCHOOLS

CLINTON CENTER

This is a textbook example of a bedroom district. The town has very little support industry or business; yet, the proximity to major industrial corporations and Clinton has helped develop a flourishing support base for the district. The availability of work sites permits an active work study program for high school students. This program is the best career preparation process. The office education and trade and industry are considered the best career preparation programs.

Camanche provided all of the data requested for this project. Their willingness to cooperate is also evident in the expressed interest in providing release time for cooperative district programs. The elementary and middle schools actively particpated in DeWitt's career education development program during the 1973-74 school term. This assistance was regarded as helpful and worthwhile by the participating personnel. A principal reason for the continuance of the effort initiated last year is the enthusiasm and continual support provided by the counselor who works in the two schools.

While many good aspects of the district are evident, there are three major problems. In the grades K-8, there is no knowledge of the efforts or objectives in each grade level. Particularly in the primary grades, the program is well organized for each grade level; but not sequentialized from one grade to the next. This is probably due to the lack of a written or documented packet for the program. There was some segregation by sex reported in career laboratories, but once the new high school is completed additional space should provide more work stations. In the high school, there is very little evidence

of career education outside the work-study program. Several instructors were discouraged by the students' efforts to manipulate their employment into a higher priority than their education.

The district has initiated its career education program. By utilizing scheduled in-service, the program could be expanded and sequentialized. The primary task appears to be the need to develop programs to fill in existing voids while also encouraging the further development of career education.

CENTRAL COMMUNITY SCHOOLS

CLINTON CENTER

This is the most dynamic district in Merged Area IX in its independent development of career education. A previous grant to the district resulted in a three year project which was offered to districts within Clinton County during the third year (1973-74). Presently another model program is being utilized in the career exploration stage. The initiative of the district and the administration's support of career education is absolutely phenomenal.

There are some policy decisions that could be questioned. Career education in the elementary schools was developed in every other grade. The junior high program is primarily operated by the counselors outside of the regular classroom. The teachers in the secondary schools expressed some disagreement about the appropriateness of career education within their classes. The ministerial decisions could be argued against; but the pervasive development of career education in grades 2-9 is excellent.

All career laboratories were reported to be coeducational. Relatively extensive in-service has occurred in some grade levels; but not throughout all grades. The counselors are reported to take an active role in assisting students, staff, and curriculum development. The resources available in the local community actively participate in providing an improved career education program.

There are two dangers in Central's program. They may proceed without assisting other districts, or they may stop the development and be content with their present program. Both are remotely possible; but based upon existing cooperative efforts and continued improvement

they are unlikely. If assistance was available to the district, then the coordination of its programs and sequential development would occur more readily. If this aid is not offered, Central may very well proceed without it. It is a truly amazing district.

CLINTON COMMUNITY SCHOOLS

CLINTON CENTER

This is one of the proposed career center districts. The implementation of career education is beginning locally. It is relatively well developed in some elementary areas and the high school vocational classes. However, a void tends to exist in the arts and sciences areas of the high school. This may be due to a lack of information or lack of direction.

Clinton reports all of its career laboratories as being co-educational. It also has a formal written policy statement from the Board of Directors concerning career education. Its approach to in-service has been to utilize a diverse program involving media, personnel, simulations and consultants. Overall the district, although experiencing a change in administration for the 1975-76 term, appears to be responsive to the mandate for implementing career education.

The major concern reported was the need for a K-12 director. At this time the lack of such a position has resulted in a more deliberate and disconnected approach than would be occurring with such a director. Some concern must be noted in regard to the relationship between the community college and district personnel. The majority of the interaction is cooperative and helpful; but, some dissention or antagonism was expressed. By building upon the positive relationships and cooperating, the two institutions will be better able to serve their clients and Merged Area IX.

Some cooperative programming or efforts with other districts already occurs. The district offers its own adult education program. The conscious intent to work towards becoming a locus of assistance

to other districts will be of benefit to the community and the participating students.

ANDREW COMMUNITY SCHOOLS

MAQUOKETA CENTER

This is a district of relatively few community resources. Some business does exist locally, but much of the community contact is with Maquoketa. Andrew is also one of the single site facilities that exist in Merged Area IX.

With a small faculty, all located on a single site, it should be less difficult to arrange and conduct in-service. The district reported eight days of in-service for the entire staff. These two factors provide an excellent opportunity to develop and continually support the implementation of career education.

All of the career laboratories were identified as coeducational. The district expressed interest about participating in co perative programs with other districts. An early release policy was tenatively approved by the Board of Directors for students to engage in work experience.

There are some concerns evident in the district. Frequent reminder of the legislative mandate occurs, yet the staff expressed little awareness of available sources of assistance. Very few of the staff members could verbalize the concept of career education or their respective stage. As a result, they were not sequential in their approach to career education.

The future is not all despair for Andrew. They will be hiring a new counselor and hope to obtain a person with a background in implementing career education. Once all the parameters and elements of career education were presented to the staff, they could relate activities to the intent of career education. At least one

individual was working from an objectives-activities framework in implementing career education into the classroom.

Like similarly situated districts, Andrew needs a great deal of assistance in initiating its program. If a reorientation occurs within the district, and if direction and continued support emerge to help the personnel, then career education will probably be successfully developed.

BELLEVUE COMMUNITY SCHOOLS

MAQUOKETA CENTER

The district is unusual. It does have a local business community. It has a contingent of residents who migrate to employment in Dubuque. It also has an agrarian society. With elements of each class of districts, it was difficult to classify Bellevue. It was finally placed in the rural class primarily due to its size and organization.

This was one of the more classic examples of the difference between what is reported-intended and what actually occurs. Purportedly the career education curriculum is coordinated K-12 and the counselor is a dynamic force in the entire program. Upon investigation the same confusion of most districts concerning both the concept-stages of career education and also the objectives of other grade levels was expressed by staff members. The counselor was involved in the high school program, but commented that he did not even have time to visit the elementary school

The district does provide four days of in-service. Interest was reported in cooperatively participating with other districts. All career laboratories were reported as being coeducational. With the multiple types of employment sites originally identified, an exceptional opportunity for a very effective early release-work study program exists.

The district needs appropriate information to be able to correctly present and initiate career education. Once the information is gathered, a critical need for effective leadership will emerge. Without this combination of knowledge and direction, the district will not be able to avail itself of the potential that exists.

CALAMUS COMMUNITY SCHOOLS

MAQUOKETA CENTER

A very pragmatic approach to complying with the legislative mandate is evidenced in this district. Particular staff have been designated as teaching or having periods to practice career education. One staff member persistently questioned how any additional subject could be added to a full schedule of activities and courses. Apparently this labeling or designation is one approach.

Calamus is fortunate in having an identifiable, although small, business district. This provides some advantage over the rural districts without any resources available for explortation. Some isolated instances of appropriate career education activity are evident. This is probably due to the assignment approach of the district rather than the rejection of the concept by the remaining staff.

The district has some reported segregation in its career laboratories. A willingness to provide release time for cooperative programs was expressed. No in-service has been provided to date, and this is identified as the major need of the district. Office education is considered the best career prepatory program.

The major concern about the present program is its very nature. If career education is envisioned as another subject and merely tacked-on to the existing curriculum, then it will have little effect. This may be a very efficient approach; but, the outcome would be questionable. If a district elects to encourage advocates to develop and implement career education with the intent that success will stimulate additional staff to participate, then the approach is valuable. If the intent is to give the appearance of compliance, then the approach

could be a more token effort at compliance.

With some initial assistance, and with continued support, Calamus will be able to implement a successful career education program. It will take a much longer period of time to develop the same program if no assistance is provided.

DELWOOD COMMUNITY SCHOOLS

MAQUOKETA CENTER

This is a rather typical rural district. Resources available are limited without venturing out to a nearby city. The attitude expressed by staff members was "we do the best we can with what we have". This is admirable.

Delwood is a previously reorganized district. One counselor is located at the secondary facility. The personnel visited were interested in career education to the extent that it would improve their skill or subject matter. If it would help students, it was useful. At both the secondary and elementary facilities particular interest in available materials or suggestions was expressed.

Some career laboratories are segregated. This was explained as primarily a space-available problem. The career education efforts in the elementary school are monitored by the principal since the counselor is obligated to the secondary school. With these limitations, the district is still quite receptive to career education. Release time was reported as being possible for all grades in the secondary school. DeWitt's project was viewed as helpful by the staff who had an opportunity to participate.

The most pressing need in the district is for a coordinating force to emerge. Funds are not readily available locally, and some question as to expertise in regard to career education is appropriate. The situation is like every other district in Merged Area IX; it is just a matter of degree. The district will work as diligently as possible given the resources available and local proficiency. A major issue is how these efforts could be increased and improved via a consultant or in-service.

EAST CENTRAL COMMUNITY SCHOOLS

MAQUOKETA CENTER

This is the newest district due to a merger of Sabula and Miles school districts. The major thrust during the 1974-75 school year was to begin coordination and cooperation between the two locations. This type of voluntary merger must be commended. As enrollments and budgets cease their growth, an increasing number of sharing ventures or similar mergers will likely occur. By discussing the difficulties, procedures, and successful activities with districts that have instituted sharing or mergers, proposed arrangements should be less difficult.

With East Central problems do exist with regard to the development of career education. No in-service has been conducted yet, and the general understanding of career education is totally lacking. Each person interviewed believes it is either the task of someone else, or that they must have the other person's assistance before anything can be done. Career laboratories are available to males and females, but as separate classes. It is indeed surprising that a recently merged district would not have the schedule capacity for release time and would see transportation as a major problem.

Undoubtedly the major concern with East Central's potential for developing career education is its existing ignorance. At one point the director was told that a staff member was unaware of any career education meetings in the state of Iowa during the 1973-74 term. Each of the Iowa Project's documents published by the State Department of Public Instruction has been viewed as a new career education manual. With this confusion prevalent, it is practically impossible

to envision any successful documentation or improvement of existing career education efforts. Some type of in-service assistance must be provided if East Central is to develop and implement career education.

LOST NATION COMMUNITY SCHOOLS

MAQUOKETA CENTER

Like several other districts in Merged Area IX, Lost Nation has its educational facilities on one central site. The adjacent community is quite small with limited opportunity for use as a career education resource. Throughout the project's duration the plea for philosophy and in-service has been most frequent from this district. A tremendous need exists to assist districts, in these particular circumstances, to maximize their use of the resources available.

The major asset of the district is the receptiveness of its staff. During discussions about alternatives for, or additional means of, further developing programs, the faculty maintained a high level of interest. They seemed aware of the district's constraints, but were willing to consider suggestions. The best career preparatory program is office education.

Some segregation was reported in the career laboratories. A general need to improve each laboratory was also reported. Recognizing these problems, the district experessed a willingness to provide release time for cooperative programs. The most pressing concern is the very nature of the district. Due to its size and location the administration and staff are very thin. No provision exists for in-service. Sharing of staff with other districts is utilized. The counselor doubles as a teacher. The issue is not whether this is correct or incorrect; rather what can be done within this set of circumstances.

With some assistance and support, the impressive concern for

student needs and the expansion of existing efforts will yield a better utilization of the available resources. Without the philosophy and in-service, the district will have difficulty.

MAQUOKETA

MAQUOKETA CENTER

Maquoketa was selected as one of the five proposed career center sites. It has a metropolitan center for work experience cooperatives and is within thirty miles of the participating districts. It has had some remarkable applications of career education concepts including a summer raft trip on the Mississippi River for science and a documentation approach to coordinate the elementary school program.

The administration is keenly aware of the legislative mandate for both career education and community needs assessment. A Metropolitan Alternative Classroom exists for students outside of the regular secondary school. It is located in the downtown area and requires each student to obtain employment as a course requirement. With the exception of agriculture, all of the existing career labs are coeducational. The district is not only willing to provide release time for student cooperatives, but also actively pushes this concept. If a program would be beneficial to students, the administration would support it.

Two principle problems are evident. Being a metropolitan district, some isolated pockets are quite successfully utilizing career education concepts. The difficulty is in articulating and communicating these successful experiences. Thus far only eight K-12 teachers have been involved in career education in-service. The second concern is the activism that is so encouraging. In becoming a center for consumption by nine other school districts, Maquoketa could adopt a personally progressive role. This would preclude documentation of and developmental aid to programs in the other districts as they begin to develop.

Overall, Maquoketa appears readily willing to become a more dominant figure in the development of career education in Merged Area IX. The major task for the district and its proposed career center will be the orderly development of cooperative programs between participating districts. The best career preparation is in the district's seveu work experience programs.

NORTHEAST COMMUNITY SCHOOLS

MAQUOKETA CENTER

This is a difficult district. Like many in Merged Area IX, previous reorganization has left outlying elementary facilities on sites other than the present administration complex. The present secondary facility is located in a town of approximately 190 residents. Within these circumstances, the effective development and organized implementation of career education will be difficult. Staff from various elementary sites tend to have little idea of what other locations within their district are going, even in the same grade.

Yet, there is promise. The administration is energetic and their position on the mandate for implementation is to support and encourage cooperative exchange between districts. Northeast is one of the few districts that supplied all of the data requested by the project. In-service is available as a means of integrating career education. The elementary staff all spoke highly of the DeWitt project which assisted them during the 1973-74 term.

All of the career laboratories are coeducational. A new industrial arts facility was opened in 1975. The secondary complex does have a counselor in both the junior and senior high school. Although some staff were resistent to "adding a new program", several, especially in the elementary schools visited, were receptive to the concept of career education as a means of motivating students and improving education.

The most severe lack in the district is an organized approach to implementation. The district's capacity to develop and limitations of its programs are evident to personnel. Yet, little has been done

to maximize what opportunities do exist. Assistance in documenting and sequentializing the existing program would serve as a prelude to improving the development of career education. Without this assistance, the district has the ability to identify and improve its efforts; but may not have the time and opportunity.

PRESTON COMMUNITY SCHOOLS

MAQUOKETA CENTER

This is a small, but growing school district. An addition to their existing high school building will provide more space. There are two staff factions that were apparent: the career education is bad, and the I'm willing, but how do I start. The former will require a great deal of assistance, evidence, and perhaps direction to integrate career education into their program. The latter will very likely lose their receptiveness if they are not provided with meaningful assistance in a timely manner.

Perhaps the most discouraging point was the lack of awareness of existing information. Preston has not yet had any career education in-service and according to the data received, the staff is not using any career education materials. Their counselor is in a halftime faculty position and attempts to assist students in either individual contacts or a junior-senior occupations class. A similar class is taught in the eighth grade.

The previsitation data was without notation of any career labs. Apparently this was due to a lack of communication, because they do offer courses in the designated areas. The best career preparation program was identified as woodworking-cabinetry. One of the concerns expressed was how coeducational classes would be developed rather than having separate classes for males and females.

It is not evident how Preston will emerge. They have not yet made any effort to implement career education and some of the staff appear determined to resist any assistance short of a new provision in their contracts. Some of the media and activities presently used

do represent career education concepts. In this particular situation, with these circumstances, it seems even more imperative to both dispel the ignorant- incorrect perceptions and to also document-abet the improvement of existing practices.

COLUMBUS COMMUNITY SCHOOLS

MUSCATINE CENTER

The Columbus district is relatively small in size; but quite metropolitan in aspiration and effort. It is one of the two districts located in Wapello County and part of Merged Area IX. It is one of the few districts to have conducted career education in-service during the school year and during the summer. Further, its administration has one of the very few formal written policy statements. All of its career laboratories are reported as being coeducational.

While Columbus must be recognized for its prompt and significant efforts in developing career education, the district has some problems. Although it is identified as a rural district, much of the planning is similar to a metropolitan district. Work experience cooperative programs are used and supervised by the instructor during a designated daily period. This is remarkable, but could be unfortunate for two reasons: local employment is limited and having the well developed system in existence could result in a lack of interest in utilizing the proposed career centers. At some point, an effort should be made to document existing practices. Like several other districts, Columbus has branch schools in nearby towns. These staff members expressed the lack of involvement and alienation of being a second-class priority. Loyalty was relatively restricted to the building with the general attitude that the school district was detached from the branch school.

The further development of career education in Columbus will likely focus on refining and expanding opportunities. With the reservations identified supra, the administration recognizes the need to improve existing career laboratories and work stations and

the possibility of providing release time for high school students. The best career preparation program identified was the work experience cooperatives. The district did request consultants and additional career education in-service as a means of further implementing career education.

DURANT COMMUNITY SCHOOLS

MUSCATINE CENTER

This is one of the two school districts that is in Cedar County, yet is part of Merged Area IX. Although Durant is in the process of constructing a new secondary facility, the proposed industrial arts section had to be excluded due to budgetary restraints. The administrative staff is aware of the career education mandate, and they have some personnel and activities doing successful work. Their principal failing is the lack of an identified coordinator and the subsequent confusion that occurs without a sequential coordinated program.

Transfer of functioning to Mississippi Bend on July 1, 1975 should help the district. They will have contact with only one agency then and they will also have access to the career education consultant. The district's major problem is obtaining the time to document and improve the program they presently have. This will be difficult within their existing functioning since they only have two in-service programs and question the fairness of retaining staff after 4:00 P.M. to work as committees.

An effort is being initiated to function cooperatively with the Wilton Community Schools. Although this was not for career education purposes, such cooperative efforts must be encouraged. Many of the vocational offerings are presently segregated; but once the new secondary facility is developed there will be additional space for conducting coed classes.

Major priority was placed upon in-service and curriculum development. The district does appear to be aware of the need and a method of integrating career education into their program. They are currently lacking the means to achieve this integration.

LOUISA-MUSCATINE COMMUNITY SCHOOLS

MUSCATINE CENTER

This is the other district located in Louisa County yet part of Merged Area IX. The district reported having a formal written policy statement on career education. This would make it one of the few districts that has a written expression of its committment to career education. Provision is made for in-service of the entire staff on career education.

All of these things would be likely to produce a very effective program. To this point they have not. Louisa-Muscatine does have some staff that are attempting to implement career education, yet others are either tired of trying or are reluctant to even attempt. None of the instructional staff disagreed with the concept; but, several in the high school questioned whether it would be successful in their district.

The district does attempt to comply with the legislative mandate. It has conducted a community needs assessment. The most disturbing fact is the lack of any evidence of an effect from these overtures. While effort is evident, effect is not. Chronic segregation was reported in career laboratories; but, the facilities are intended to become coeducational during the 1975-76 term.

The district is receptive towards release time for cooperative ventures. Some staff are attempting to simulate or implement career education in their classrooms. The high school will be hiring a new guidance counselor for the new term. The elementary and junior high school intend to begin the new year with the intent to develop career education. Through each of these opportunities, Louisa-Muscatine has

the possibility of improving its present program. Many of the prerequisites are in existence. It is a matter of coordinating them towards a common objective.

By providing support and direction to the district, this improvement process would be more efficient. Without the assistance, the district will be left by itself.

MUSCATINE COMMUNITY SCHOOLS

MUSCATINE CENTER

This is the only district in Merged Area IX to have a full-time Career Education director. Based upon this district commitment and the increasing development of Muscatine as an industrial center, the implementation of career education is occurring. Some of the surrounding districts have been able to utilize materials or information in cooperative development efforts.

Muscatine's problems are primarily time and improvement of existing efforts. Career education is being treated as a continuing process and considerable effort is expended to involve the entire community in the implementation. Communication and direction is evident, although some reluctance, by individual educators, to become actively involved is occurring. As the local community continues to grow and prosper, the district will be able to benefit by arranging more realistic work release stations and developing a more diversified and specific prepatory program in conjunction with the emerging industry.

A few career laboratories were segregated, but the anticipated growth and new facilities will permit more students to participate. The district and the community college will cooperatively engage in an exploratory program concerning both welding and construction clusters during the 1975-76 term. This type of effort is beneficial to the students and the community.

The district is past the stage of initiating a career education program. A real need exists for assistance in both improving their program and communicating it to other districts. By serving as one of the proposed career centers, Muscatine would be able to assist the implementation of career education in Merged Area IX.

WEST LIBERTY COMMUNITY SCHOOLS

MUSCATINE CENTER

There are some real disadvantages being located near a state university and West Liberty can enumerate them. This district does have the opportunity to participate in a newly created career skill center being built in Iowa City. Merged Area X will offer four vocational programs in the fall of 1975. Tuition will be paid by the school district, but transportation remains a slight problem.

One of the administration's major concerns was how to proceed in identifying community needs for the development of new programs. Some concern was expressed about the method of documenting objectives and existing practices for the State Department of Public Instruction. Two other problems are evident. Nichols is a satellite school for West Liberty. Some staff members were not aware if subject matter content was coordinated in the grade levels between the two locations. Secondly, a signifficant Spanish-American population lives within the district. This represents a different culture than that of the staff.

Presently a new industrial arts complex is planned to open in 1975. This should provide increased space for existing and, perhaps, new programs. Only the home economics program is segregated. All other career labs are coeducational. Although West Liberty has not conducted any career education in-service, some of the staff are integrating concepts individually.

Depending upon the resources and priority given to career education, West Liberty could develop a good program. Staff members are not conversant in career education jargon; but appear to be receptive to assistance. In-service education was recognized as a readily available means of updating the staff's educational perspective, documenting

existing practices, and developing an improved integration of concepts into all curriculum.

WILTON COMMUNITY SCHOOLS

MUSCATINE CENTER

This district's development of career education is totally informal. Through a combination of events and circumstances, very little empirical data was obtained. The reported position of the district regarding career education is derived via interviews.

Awareness of the mandate exists, yet encouragement to develop programs and implement the concept, is lacking. The obvious confusion about the concept, objectives and stages, does exist. In all of the contacts with district personnel, not one career education program or activity was identified.

Wilton does have potential. Its administrative staff is thin, but the recent increases in industry may provide the population increase necessary to justify a new position. Its local industry and its proximity to Muscatine offers a tremendous opportunity for a work release program. Initial academic exchange will occur between Durant and Wilton during 1975-76. The construction of a new vocational agriculture center and this tenative cooperative venture indicate the district's willingness to develop a career education program.

What is most lacking is expertise and assistance. The elementary junior high school programs are within the same facility. This closeness and the existence of several effective programs and techniques for these grades in Merged Area IX could readily develop the program in those grades. The senior high school lacks coordination and direction. If assistance is made available, the district could develop and integrate career education effectively. Without this aid, the resources are available, some staff are ready; but, the priority does not exist so the program will not flourish.

BENNETT COMMUNITY SCHOOLS

SCOTT CENTER

The two most evident constraints of the Bennett School District are its small size and its location. It is located in Cedar County, but a member of Merged Area IX. The principal difficulty with its location is the existence of only one connecting highway with the rest of the merged area. Thus, although Bennett is closer to Muscatine, it is part of the Scott Career Center.

Bennett experienced an administrative change during the 1974-75 school year. As a result, the new administrative group has actively initiated the implementation of career education. The district is conducting its community needs assessment and believes its welding program provides the best career preparation.

All of the district's career laboratories are coeducational. They presently have staff on split assignments between the elementary, junior and senior high school. Consequently, cooperative release time, although a district priority, would not be easy. The district has not conducted career education in-service yet, but some staff are using their self prepared materials. Largely via committees, the staff has produced an elementary school career education handbook.

The future for Bennett's career education development is promising. Their initial efforts serve as a challenge to similar small districts that disclaim the ability to develop career education because of their size. The district will make some mistakes; but the prevailing staff attitude, the existing administrative leadership, and the evident intent to implement career education will collectively produce a better program. If provided additional assistance (in-service,

consultant, or evaluative recommendations), the district will be able to both avoid some mistakes and share its successful efforts with other rural districts.

BETTENDORF COMMUNITY SCHOOLS

SCOTT CENTER

Bettendorf is an aggressive modern district. The willingness of its personnel to assist the project was remarkable and must be commended. Literally more data was received than could be used.

The career education implementation is in a rather embryonic stage. Some expression of a lack of administrative recognition and support was made, but there was also evidence of an intent to initiate a successful program. The middle school was just beginning a full evaluation of both its and the district's career needs. Nominal effort was existing at the elementary school visited, but the intent to initiate efforts during the summer of 1975 was mentioned. At the high school, vocational staff members were receptive to developing cooperative programs with adjoining districts. Although the arts and sciences faculty were not as advanced in, or even knowledgeable of, career education, the members visited were willing to learn.

This is one of the proposed career centers. The present work release programs and the receptiveness of the personnel directing these programs towards working with other districts will definitely benefit participating students. The apparent need is for assistance in establishing a consensus approach and then documenting and improving existing programs. If the district avails itself of existing objectives, activities, and recommendations, it will readily develop a more integrated career education program.

NORTH SCOTT COMMUNITY SCHOOLS

SCOTT CENTER

North Scott is the most rapidly growing district in Merged Area IX. It is a bedroom district to the Davenport-Bettendorf business industrial area. The district has the potential to become one of the major career education programs in Merged Area IX: increasing population, available resources, and expanding facilities.

Seven days of in-service are presently scheduled providing a pregnant vehicle for delivery of a concept or approach. Administration and additional non teaching staff are sufficient to assure the operation of the district. With some effort, an existing position could be reidentified as career education specialist. The new role would be primarily a coordinating resource position.

One very impressive program was being used in the elementary school by its developer. Yet, the instructor was unaware if the other elementary buildings had the opportunity to utilize the program per had developed. The urgent need is to begin sharing and cooperating within and between the respective buildings and personnel. Such a great emphasis is placed upon coping with the future growth that the present need to implement and coordinate career education assumes a secondary position. The district is willing to enter into cooperative programs and provide students with release time to participate.

The career laboratories were either coeducational or separate facilities for males and females according to the report. The counselor was not identified as an active agent in developing or coordinating career education. The Board of Directors was not identified as having issued policy statements on various aspects of career education.

Collectively the outlook for career education is promising. Several prerequisities are lacking; but, sufficient opportunity and means does exist to develop a dynamic program. What is presently lacking is a district commitment. This is partially due to a dearth of knowledge and also the lack of direction because of the emphasis upon coping with the rapid growth.

Effective in-service would serve as an initial action to stimulate additional efforts by the staff. After some organizational aid, the district would be better prepared to continue to develop its own program.

PLEASANT VALLEY COMMUNITY SCHOOLS

SCOTT CENTER

This is a very interesting district. By working with the chairperson of the district's career education program, most of the requested data was obtained. The extent of development of career education ranged from nominal effort to a directed documentation of program and objectives in the junior high. The latter technique is remarkably simple, yet serves as the foundation for revising or improving any existing programs.

In-service with consultants had been conducted. The district has a committee working on the coordination of a K-12 curriculum. All career laboratories were reported as being coeducational. Release time for cooperative experiences was reported as a realistic opportunity. The attitude of several staff members was quite laudable. The secondary facility literally adjoins the Scott Community College site. New vocational space will open in the 1975-76 term.

All of these factors should yield a dynamic and progressive career education program within the district. But, they do not. Efforts are relatively confused. Previous contact with career education by some secondary staff was identified as a disaster. The recovery from that experience has been gradual. One of the secondary counselors had a prolonged illness which decreased the effectiveness of the other counselor. Some leadership exists and in those areas, programs have been identified and developed.

The district has all of the essentials for a successful program. Yet, some thing or combination of events has estopped this metamorphosis. By offering assistance and expertise concerning career education to the district, the development of an effective career education program and the process of that transition would be both more evident and less difficult.

COMPOSITE PROPOSED CAREER CENTER DATA

The data compiled from responses elicited in each district are recorded in the following four categories:

CAREER EDUCATION ATTITUDE SURVEY

Non-Teachers
Teachers
Students
Citizens

SURVEY OF HELPING RELATIONSHIPS

INTERVIEW FORMAT

CAREER CLUSTER CHECKLIST

Data is presented on the basis of the four proposed career centers. Davenport elected not to participate, so their proposed career center has no data. Other districts did not return their materials by the May 31, 1975 deadline, so some of their responses are not included in the totals.

INTERVIEW FORMAT - COMPOSITE

(PROPOSED CLINTON CENTER)

Question #	Response
I. A.	Two districts have formal written career education policy statements.
II. A.1	Three districts use two days for pre-school workshop in-service training. The range in participant number is six to seventy.
II. A.2	Two districts use in-service training during the academic year. The range in participant number is thirty to three hundred.
II. A.3	One district uses in-service training during the summer. The participant number is sixty.
II. D.1	Two districts use speakers.
II. D.2	Two districts use consultant teams.
II. D.3	One district uses role playing or simulation.
II. D.4	One district uses staff career visits into the community.
II. D.5	Three districts use multi-media presentations.
II. E.	Two districts evaluated their in-service as good and one evaluated it as poor.
III. A.1	Two districts use commercially prepared material.
III. A.2	Two districts use staff prepared material.
III. A.3	Two districts reported curriculum coordinated on grades K-12.
III. A.4	One district uses resource people in curriculum development.
III. B.	Students career education needs were identified by the following evaluation method:
III. B.1	One district by student interviews.
III. B.2	Two districts by student surveys.
III. B.3	Two districts by a study of employment opportunities.
III. B.4	One district by review of the student's cumulative records.
III. C.	One district integrated job seeking skills into the curriculum while two districts did this and taught it as a separate entity.
IV. A.	Two districts have a board policy on career visits.
IV. B.	One district has reviewed the policy.
IV. C.	Two districts coordinate career visits by grade level and content.

V. A. One district has a board policy on the use of community resource people.

V. B. Two districts have reviewed the policy.

V. C. Three districts' administration encourage teachers to use community resource people.

V. D. Two districts' counselors use community resource people.

VI. District counselors are involved in career education in the following ways:

VI. A. Three assist planning career visits.

VI. B. Three assist coordinating community resource people.

VI. C. Three assist career curriculum development.

VI. D. Three assist student self-awareness as it relates to career education.

VI. E. Two assist student understanding educational alternatives.

VI. F. Three assist student awareness of the world of work.

VI. G. Two assist knowledge of skills and beginning competencies.

VI. H. Two assist directing student exposure to employability skills.

VII. A. The following number of districts identified programs within their Junior High-Middle School:

	Male	Female	Coed	Special Ed.
Home Economics		1	2	1
Woodworking	1		2	2
Metals			2	2
Mechanics			2	2
Plastics			1	
Agriculture			1	1
Leather & Crafts			1	

VII. B. The following number of districts identified programs within their High School:

Drafting			3	1
Metal Shop	1			1
Wood Shop			3	
Automotive Mechanics	1		2	1
Building Trades			1	
Electricity			1	
General Shop			2	
General Mechanics			1	
Nursing		1		
Photography			1	
Trades and Industry			2	
Bookkeeping			3	
Journalism			1	
Office Machines			2	
Office Practice			2	
Publications			1	
Salesmanship			1	
Shorthand			2	
Typing			3	
Child Development			2	
Clothing		1	2	

	Male	Female	Coed	Special Ed.
Foods		1	2	
Home Economics		1	2	
Tailoring			1	
Family Living			2	
On-Job-Training:				
Distributive Ed.				1
Office Education			2	
Trades & Industries			2	
Work Release Program			2	1

VIII. A. The proposed centers ranked the composite priorities as follows:
In-service
Effective use of community resource people
Curriculum development
Coordinated use of career visits
Coordinated use of career laboratories

VIII. C. Districts were willing to allow release time for cooperative inter-school programs in the following grades:
One in Junior High
One in Ninth grade
Two in Tenth, Eleventh, and Twelfth grades

VIII. D. None of the districts reported that transportation would be a major problem for participation in inter-school programs.

INTERVIEW FORMAT - COMPOSITE

(PROPOSED MAQUOKETA CENTER)

Question #	Response
I. A.	No districts have formal written career education policy statements.
II. A.1	Three districts use three days for pre-school workshop in-service training.
II. A.2	Five districts use in-service training during the academic year. The range in participant number is six to fifty-two.
II. D.1	Two districts use speakers.
II. D.2	Two districts use consultant teams.
II. D.3	One district uses role playing or simulation.
II. D.4	One district uses staff career visits into the community.
II. D.5	Two districts use multi-media presentations.
II. E.	Two districts evaluated their in-service as good and one evaluated it as poor.
III. A.1	Five districts use commercially prepared materials.
III. A.2	Six districts use staff prepared material.
III. A.3	Three districts reported curriculum coordinated on grades K-12.
III. A.4	Four districts use resource people in curriculum development.
III. B.	Students' career education needs were identified by the following evaluation method:
III. B.1	Six districts by student interviews.
III. B.2	Four districts by student surveys.
III. B.3	Three districts by a study of employment opportunities.
III. B.4	Five districts by review of the students' cummulative records.
III. C.	Two districts integrated job seeking skills into the curriculum.
IV. A.	Two districts have a board policy on career visits.
IV. B.	One district has reviewed the policy.
IV. C.	Four districts coordinate career visits by grade level and content.
V. A.	Two districts have a board policy on the use of community resource people.
V. B.	No district has reviewed the policy.

V. C. Six districts' administration encourage teachers to use community resource people.

V. D. Five districts' counselors use community resource people.

VI. District's counselors are involved in career education in the following ways:

VI. A. Four assist planning career visits.

VI. B. Four assist coordinating community resource people.

VI. C. Five assist career curriculum development.

VI. D. Five assist student self-awareness as it relates to career education.

VI. E. Five assist student understanding educational alternatives.

VI. F. Five assist student awareness of the world of work.

VI. G. Five assist knowledge of skills and beginning competencies.

VI. H. Five assist directing student exposure to employability skills.

VII. A. The following number of districts identified programs within their Junior High-Middle School:

	Male	Female	Coed	Special Ed.
Home Economics			2	1
Woodworking			4	
Metals	1		3	
Mechanics	1		1	
Plastics		2	1	
Typing		2	1	
Agriculture	1	1		

VII. B. The following number of districts identified programs within their High School:

Drafting	3	1	4
Metal Shop	4	1	3
Wood Shop	3	1	4
Agriculture Mechanics			3
Automotive Mechanics	4	1	2
Building Trades	2	1	2
Electricity	1	1	3
Electronics	1	1	3
General Shop	1	1	2
Horticulture			1
General Mechanics	1	1	1
Nursing			1
Photography			3
Bookkeeping	1	1	5
Journalism			4
Office Machines	1	1	4
Office Practice	1	1	5
Publications	1	1	4
Salesmanship			3
Shorthand			4
Typing			2
Child Development		2	3
Clothing	1	2	3

	Male	Female	Coed	Special ed.
Clothing	1	2	3	
Foods	1	3	3	
Home Economics	1	2	4	
Tailoring	1	1	2	
Family Living	1	1	4	
On-Job-Training:				
Distributive Ed.			2	
Office Education			2	
Agricultural Ed.			2	
Work Release			2	

VIII. A. The proposed center ranked the composite priorities as follows:
In-service
Curriculum development
Coordinated use of career laboratories
Coordinated use of career visits
Effective use of community resource people

VIII. C. Districts were willing to allow release time for cooperative inter-school programs in the following grades:
Two in Junior High
Two in Ninth and Tenth grades
Five in Eleventh and Twelfth grades

VIII. D. Five of the districts reported that transportation would not be a major problem for participation in inter-school programs.

INTERVIEW FORMAT - COMPOSITE

(PROPOSED MUSCATINE CENTER)

Question #	Response
I. A.	Three districts have formal written career education policy statements.
II. A.1	Four districts use two days for pre-school workshop in-service training. The range in participant number is zero to sixty.
II. A.2	Three districts use in-service training during the academic year. The range in participant number is one to sixty.
II. A.3	One district uses in-service training during the summer. The participant number is one.
II. D.1	Two districts use speakers.
II. D.2	Three districts use consultant teams.
II. D.3	One district uses role playing or simulation.
II. D.4	No district uses staff career visits into the community.
II. D.5	Three districts use multi-media presentations.
II. E.	One district evaluated its in-service as excellent and one as fair.
III. A.1	Two districts use commercially prepared material.
III. A.2	Four districts use staff prepared material.
III. A.3	One district reported curriculum coodinated on grades K-12.
III. A.4	Three districts use resource people in curriculum development.
III. B.	Students' career education needs were identified by the following evaluation method:
III. B.1	Three districts by student interviews.
III. B.2	Four districts by student surveys.
III. B.3	Two districts by a study of employment opportunities.
III. B.4	Three districts by review of the student's cummulative records.
III. C.	Two districts integrated job seeking skills into the curriculum while two districts did this and taught it as a separate entity.
IV. A.	Two districts have a board policy on career visits.
IV. B.	One district has reviewed the policy.
IV. C.	Two districts coordinate career visits by grade level and content.

V. A. Two districts have board policy on the use of community resource people.

V. B. One district has reviewed the policy.

V. C. Four districts' administration encourage teachers to use community resource people.

V. D. Four districts' counselors use community resource people.

VI. District's counselors are involved in career education in the following ways:

VI. A. Three assist planning career visits.

VI. B. Four assist coordinating community resource people.

VI. C. Three assist career curriculum development.

VI. D. Four assist student self-awareness as it relates to career education.

VI. E. Four assist student understanding educational alternatives.

VI. F. Four assist student awareness of the world of work.

VI. G. Four assist knowledge of skills and beginning competencies.

VI. H. Three assist directing student exposure to employability skills.

VII. A. The following number of districts identified programs within their Junior High-Middle School:

	Male	Female	Coed	Special Ed.
Home Economics		2	1	1
Woodworking	1		1	
Metals	2			
Mechanics	1			
Typing			1

This is just a brief note to verify your acceptance of the position as a member of the steering committee. I wish to thank you for volunteering your services. Our first meeting is scheduled for January 14, 1975 at 1:30 P.M. It will be held in the Board Room of Eastern Iowa Community College District Central Office at 3546 Brady Street, Davenport, Iowa.

It is extremely important to this Assessment Project that you attend as regularly as possible. We will try to give you advance notice of all meetings and include an agenda of what is to be discussed. If at any time you have additional information or thoughts concerning the Project, please feel free to contact us at our Davenport office.

Thank you very much.

Sincerely,

EASTERN IOWA COMMUNITY COLLEGE DISTRICT

January 15, 1975

Enclosed are the minutes of the Career Education Needs Assessment Steering Committee meeting of January 14, 1975.

This first session was not designed to be extremely productive, rather an overview of both the Project and also the committee members' roles was intended.

The next meeting is tenatively scheduled for February 17, 1975 at 3:00 P.M. It will be held at Clinton Community College in Room 140. A verification of the date and time, the room assigned for the meeting, and an agenda for that meeting will be mailed in early February.

Sincerely,

EASTERN IOWA COMMUNITY COLLEGE DISTRICT
(MERGED AREA IX)

SUMMARY

CAREER EDUCATION NEEDS ASSESSMENT
STEERING COMMITTEE

January 14, 1975

Present: N. Boyle (for B. Steele), W. Cornelius, M. Heiler, B. Hoover, J. Lawrence, I. McCutcheon, D. McDonald, J. Manson, D. Maxwell, K. Osburn, T. Paul, E. Schreiber, R. Schultz, D. Sly, J. Soderlund, J. Stout, S. Weiler, R. Welty.

Tim Paul, the Project Director, opened the meeting at 1:30 P.M. and provided each member with a copy of the Project Abstract and a copy of the Interview Format.

In explaining the committee's role, the members were informed that they came representing a distinct background and would utilize that personal background to help solve problems brought before the committee.

In explaining to the committee why the concept of Career Education is not a mere fad, three points were mentioned:

1. Previous legislative mandates for changes in education have dealt with isolated segments of that field. With the recent U. S. Office of Education Position Paper dealing with Career Education, the intent to totally revamp public school education becomes evident. The Department of Public Instruction's underwriting of career needs assessments for all fifteen Merged Areas in Iowa evidences the state's commitment to this concept (65th General Assembly, SF 126; 1974 amendments to the Iowa Code, 257.25 Sec. 11).

2. In the existing economy, it becomes even more imperative for education to be able to justify and account for its expenditures. Career Education, by assisting the development of the students' interests and attitudes and by preparing the student for the world of work, would serve as a more objective means of accountability (A national policy on Career Education; National Advisory Council on Vocational Education; September, 1974).

3. P.A.R.C. verus Pennsylvania, Rodriguez verus San Antonio, and related judicial decisions reemphasized the individual's federal right to a public school education. Career Education serves as a vehicle for helping each individual student to identify both personal occupational preferences and a life style-career that will be fulfilling (334 F. Supp. 1253-1971; 337 F. Supp. 280-1971).

For the purposes of the Project, Eastern Iowa Community College District (EICCD or MERGED AREA IX) has adopted the operational definitions of the Iowa Project concerning the five stages of Career Education (Awareness, Accomodation, Exploration, Preparation, Supplementary) as contained in the Interview Format (Models for Career Education in Iowa, 1973).

To acquaint committee members with the Project, its objectives were presented as listed in the Abstract.

The Director mentioned the need to establish priorities (Objective #3), stating that Merged Area X had as their first priority the need to develop extension centers operated by the Community College. Superintendent Schreiber questioned when EICCD would be developing extension centers. The Director stated EICCD intends to pilot a program permiting high school students in close proximity to the three colleges in EICCD to enter vocational classes. Rich Schultz clarified that this program would be primarily for second semester seniors who could be simultaneously earning extra high school credit and community college credit by spending the entire day on the college campus.

Discussion continued over the possibility of establishing extension centers. The conclusion was that this Project would gather the data essential to make informed decisions, bring it before the committee for discussion, and finally generate recommendations to implement Career Education in Merged Area IX.

Several committee members reacted to the opportunity to make recommendations by presenting personal concerns. The need for a comprehensive philosophical definition of Career Education that could be implemented in all grades; which students would be eligible for the pilot project, how they would be transported and who would pay the tuition were mentioned as major concerns.

From the initial visitation data, a major priority was established because every district identified the need for a district coordinator or resource person. The Committee was also told that a preliminary format-procedure for implementing Career Education in every district was beginning to be developed through the initial visitation.

Each of the forms which have been developed for the Project were available for perusal and explanation. The only other material which is currently available for individual school districts' use, but will not be used for the Project, is a Community Needs Assessment instrument recommended by Phi Delta Kappa to identify Career Education needs within individual communities. The Director was emphatic that these forms are neither intended as busy work nor as a burden on the district personnel; rather they are intended to derive the empirical data necessary for making informed recommendations.

The last item on the agenda was a request for questions. Superintendent Lawrence wanted to know the tenure of the Project. He was informed that while the Project will be funded through August, 1975, the Director firmly believes that there will be subsequent development of the recommendations. Dr. Stout concurred on the probability that the implementation of the Career Education concept in Merged Area IX will extend beyond the Project's termination. He added that if the first priority remains a need for a resource person, then Mississippi-Bend should be able to present this as a Merged Area IX need and request funds from the DPI.

The next meeting will be held in February, 1975 at Clinton Community College. The topic will be establishing priorities for the needs in the district.

The meeting adjourned at 2:40 P.M.

Sincerely,

Tim Paul

February 5, 1975

TO: Career Needs Assessment Project Steering Committee

FROM: Tim Paul, Project Director

SUBJECT: Committee Meeting - February 17, 1975

The second meeting of the Merged Area IX Steering Committee for Career Needs Assessment will be held on February 17, 1975 at 3:00 P.M. in Room 140 - Clinton Community College - 1000 Lincoln Blvd. - Clinton, Iowa.

The problem for presentation is establishing PRIORITIES FOR CAREER EDUCATION NEEDS in Merged Area IX. I anticipate the meeting lasting ninety minutes to two hours, depending upon the identification of omitted needs and the extent of discussion.

If you have additional questions, please contact me at the Administrative Office in Davenport (386-1827).

Thank you.

RE: CAREER NEEDS ASSESSMENT PROJECT

The project celebrates its third anniversary February 25, 1975. After three months we are beginning to generate some work product.

In addition to the summary of the February 17, 1975 Priority Needs Determination meeting, the following products of our efforts are enclosed:

1. Merged Area IX Career Education Definition - the three source general scope, the six points inherent in a functional program, and the five areas of career education.

2. Community School Classifications - organizational grouping of the twenty-four districts in Merged Area IX according to the "Iowa Project's" criteria of classification for the purpose of future planning.

3. Both the 1973 CENIS Interface Tentative Occupational Priorities and the DPI's Priority Program Rankings - these represent occupations that need either less emphasis, due to "excess supply" or prompt development, due to "excess need". (CENIS is presently being replicated and may result in a subsequent shift of priority programs once completed).

4. February, 1975 Quarter Vocational Openings at Scott Community College - for the May, 1975 quarter both the number of offerings and openings should be greater. This is strictly a PILOT-FEASIBILITY project.

Comments? Dialogue will help the project's Master Plan be more relevant to your concerns and interests. I will be visiting the districts for the final evaluation during March. Feel free to press your concerns and interests at that time or at any convenient opportunity.

The third Steering Committee meeting is tentatively set for 3:00 P.M. on March 20, 1975 at Muscatine Community College in Muscatine.

Sincerely,

EASTERN IOWA COMMUNITY COLLEGE DISTRICT
(MERGED AREA IX)

SUMMARY

CAREER EDUCATION NEEDS ASSESSMENT
STEERING COMMITTEE

February 17, 1975

Present: N. Boyle (for B. Steele), B. Hoover, I. McCutcheon, D. McDonald, D. Maxwell, T. Paul, J. Romine, R. Schultz, J. Soderlund, G. Stevens, D. Travis, R. Welty.

Tim Paul, the Project Director, opened the meeting at 3:00 P.M. in Room 140 of Clinton Community College in Clinton, Iowa.

Each member was presented a packet containing Career Education Definition of MA IX, Tentative Occupational Priorities (CENIS-1973 Interface Summaries and DPI Priority Program Ranking), Scott Community College February Quarter Enrollment Openings, and Community School Classifications.

The question was asked "Who would be eligible to enroll in the Scott Community College openings?" regarding the Enrollment Opening list in the packet. At this time public school student enrollment would be restricted to students who 1) have completed their high school requirements, 2) have the capacity to pay Scott Community College tuition of $135.00 per quarter, 3) have the means of transportation to get to the campus, and 4) would be able to spend six hours a day, 5 days a week in a regular vocational program receiving community college credit. It is anticipated that both the number of program offerings and the number of openings within programs will be expanded. Hopefully, the other two community colleges in our district will participate in the May, 1975 quarter.

The topic for the February meeting was the identification of NEEDS and establishing priorities for them.

Multiple sources were recognized as having mandated the need for developing and implementing career education in the public schools. Several prerequisites for successful development and implementation were also presented.

Each committee member was provided with a list showing fourteen identified needs. This was not intended to be a comprehensive list, but one that contained major needs derived from the initial visit and materials presently completed by the school districts.

The result was the establishment of the following priorities ranked by importance:

1. Staff in-service training as a delivery system to disseminate the career education philosophy and develop practical applications to the classroom teachers' instruction. Other parts of the in-service training would focus on curriculum development (Iowa Project equivalent district); teacher incentive - release time, compensation, credit, etc.; local district needs and resources.

2. The retention of a Resource person or Career Education Coordinator for Merged Area IX.

3. A commitment by the local school district to reorient its educational philosophy, program, and purchasing to emphasize the need for developing and implementing career education; i.e. essentially to make maximum use of the existing capacity.

4. To identify and obtain current student interest, labor demand and occupational information.

5. Development of a more flexible curriculum by application of existing curriculum innovations (mini-courses, work release, district co-oping, competency based programs, and other alternative educational programs).

6. To institute co-oping of resources; staff, facilities, and programs. This would provide the best education for each individual student at minimal cost. It would require recognition and resolution of the school district identify/provincialism dilemma, worker migration/money problems, and tuition/transportation concerns.

7. WHO will direct the transition to and development of career education? Private enterprise? Government (state or federal)? Mississippi-Bend? EICCD? Local Districts co-oping?

8. The following identified needs were left unranked and are listed without priority importance:

   a. Flexible entry-exit; Management by objectives/Behavioral Objectives; open entry enrollment, etc.
   b. Job seeking and holding skills
   c. Identification of and delivery to dropouts, stopouts, pushouts, leftouts
   d. Population trends; K-12 student, and non-student.

Jack Romine added that once business-industry-labor could be shown the prospect of obtaining "somebody employable", then they would join in the cost of developing career education in Merged Area IX.

The next meeting will be held during March, 1975 at Muscatine Community College in Muscatine, Iowa. The tentative date is March 20, 1975 at 3:00 P.M.

The meeting adjourned at 5:00 P.M.

Sincerely,

Tim Paul

CAREER NEEDS ASSESSMENT PROJECT
EASTERN IOWA COMMUNITY COLLEGE DISTRICT

PRIORITIES RANKED BY IMPORTANCE

1. Staff in-service training as a delivery system to disseminate the career education philosophy and develop practical applications to the classroom teachers' instruction. Other parts of the in-service training would focus on curriculum development (Iowa Project equivalent district); teacher incentive-release time, compensation, credit, etc.; local district needs and resources.

2. The retention of a Resource person or Career Education Coordinator for Merged Area IX.

3. A commitment by the local school district to reorient its educational philosophy, program, and purchasing to emphasize the need for developing and implementing career education; i.e. essentially to make maximum use of the existing capacity.

4. To identify and obtain current student interest, labor demand and occupational information.

5. Development of a more flexible curriculum by application of existing curriculum innovations (mini-courses, work release, district co-oping, competency based programs, and other alternative educational programs).

6. To institute co-oping of resources; staff, facilities, and programs. This would provide the best education for each individual student at minimal cost. It would require recognition and resolution of the school district, identify/provincialism dilemma, worker migration/money problems, and tuition/transportation concerns.

7. WHO will direct the transition to and development of career education? Private enterprise? Government (state or federal)? Mississippi-Bend AEA? EICCD? Local Districts co-oping?

8. The following identified needs were left unranked and are listed without priority importance:

   a. Flexible entry-exit; Management by objectives/Behavioral Objectives; open entry enrollment, etc.

   b. Job seeking and holding skills

   c. Identification of and delivery to dropouts, stopouts, pushouts, leftouts

   d. Population trends; K-12 student, and non-student

CAREER NEEDS ASSESSMENT PROJECT
EASTERN IOWA COMMUNITY COLLEGE DISTRICT

NEEDS TO BE CONSIDERED

1. Resource person or Career Education Coordinator for Merged Area IX

2. Staff in-service training
   a. Career Education philosophy and applications
   b. Curriculum development (Iowa Project equivalent)
   c. Release time, compensation, credit, etc.
   d. Local district needs/resources

3. Flexible entry-exit
   a. Management by objectives/Behavior Objectives
   b. Competency based education

4. Co-oping staff, facilities, programs
   a. Recognize and deal with provincialism/identify of separate districts
   b. NO increased cost
   c. BEST education for EACH individual

5. Curriculum innovations
   a. Mini-course
   b. Work release (and other alternative education programs)
   c. EICC District co-oping
   d. Competency based-programmed course(s)

6. Transportation, tuition

7. Job seeking skills

8. Current occupational information
   a. Who coordinates with school
   b. Needle-sort/CAI---CISI

9. Reorientation
   a. 257.25 Section 11
   b. "Maximum use of existing"

10. Dropouts, stopouts, pushouts, leftouts
    a. Identification of
    b. Delivery to

11. Student interests (CENIS), Labor Demand (CENIS), Merged Area IX High School programs (curriculum), EICCD programs (curriculum)

12. Population
    a. Public school student (K-12)
    b. Non-student

13. Migration and Money

14. Who?
    a. Private enterprise
    b. Government
    c. Mississippi-Bend AEA
    d. EICCD
    e. Local district co-op's

March 10, 1975

TO: Career Needs Assessment Project Steering Committee

FROM: Tim Paul, Project Director

SUBJECT: Committee Meeting - March 20, 1975

The third meeting of the Merged Area IX Steering Committee for Career Needs Assessment will be held on March 20, 1975 at 3:00 P.M. in Room 27 of Strahn Hall (Lecture Hall) at MUSCATINE COMMUNITY COLLEGE - 152 Colorado Street - Muscatine.

The issue to be discussed is IN-SERVICE EDUCATION in Merged Area IX. I anticipate the meeting will last approximately ninty minutes.

If you have additional questions, please contact me at the Administration Office of Eastern Iowa Community College District in Davenport (386-1827).

Thank you.

STEERING COMMITTEE
CAREER NEEDS ASSESSMENT PROJECT

The third meeting of the Steering Committee will be held March 20, 1975 at 3:00 P.M. in Room 27 of Strahn Hall (the Lecture Hall) at MUSCATINE COMMUNITY COLLEGE - 152 Colorado Street - Muscatine, Iowa.

AGENDA

I. Status of the Project
   A. Career Centers - Enrollment Projections (Four centers, to be developed over an extended period of time, within 30 miles of any school district. Enrollment projections to maintain an adequate population of potential students - 500 minimum)
   B. Response to February Meeting work product
   C. Evaluation visit information
   D. Business-Industry-Labor and Social Service
   E. "What's happening in your district?"

II. In-Service
   A. Options
      1. On availability
         a. Location (At each of the twenty-three districts? At the four career centers? At Mississippi Bend?)
         b. Time (School year or summer? Weekday or weekend? A.M. or P.M.?)
         c. Duration (Two hour block? All at once or over an interval of time?)
      2. On incentive (Personal motivation, paid, academic credit-undergraduate or graduate; TUITION? Volunteers or required?)
      3. On organization (Component selection or a package program?)

   B. Content (See enclosed Proposed Farm-Out In-Service Course)
      1. Orientation to Career Education in Merged Area IX (What is career education? Why conduct a Career Education Needs Assessment Project? What are appropriate career education objectives?)
      2. Career Education Needs Determination (What are Merged Area IX Needs - educational, social agencies, business-industry-labor? What needs were identified by other Merged Areas? What are the needs of my school district? building? discipline or grade level? classroom? individual student?)
      3. Resources available (in existence to meet identified needs? Needed to meet identified existing needs? Identified future needs?)
      4. Management by Objectives/Behavioral Objectives (a student development technique)
      5. Career Education units (presentation of career education units from equivalent schools. Each participant observes and assists in the development of a group career education unit. Each participant personally develops two units)
      6. Values (Am I honest? Sincere? Professional? An educator? A student? a listener?, etc.)
      7. Local school career education units (package locally developed units, testimonials, criticism, etc. so the school district has a compilation of its work product)

March 26, 1975

RE: CAREER NEEDS ASSESSMENT PROJECT

This month our committee wrestled with the means of developing a delivery system for the Project's recommendations. Our primary conclusion was to offer a dual in-service; to administrative personnel at the proposed four career center sites, and to faculty personnel at the local school districts.

It is essential to understand that the Project is limited to an analysis-recommendation. The in-service program has been neither authorized nor funded yet.

The fourth steering committee meeting is tentatively set for 3:00 p.m. on April 16, 1975 at Scott Community College on Belmont Road in Bettendorf, Iowa.

Sincerely,

EASTERN IOWA COMMUNITY COLLEGE DISTRICT
(MERGED AREA IX)

Tim Paul, Project Director
Career Needs Assessment

TP/bh
Enclosures

SUMMARY

CAREER EDUCATION NEEDS ASSESSMENT
STEERING COMMITTEE

March 20, 1975

Present: B. Brandt, M. Heiler, B. Hoover, J. Manson, D. Maxwell, T. Paul, R. Schultz, D. Sly, S. Weiler.

Tim Paul, the Project Director, opened the meeting at 3:00 p.m. in Room 27 of Strahn Hall at Muscatine Community College in Muscatine, Iowa.

One of the options being considered by the Project is the development of career centers. This concept was presented to the committee and is detailed in the enclosed materials. The two primary criteria were for the centers to be within thirty miles of any school district and to have a minimum population of 500 seniors. This concept has been implemented in other districts with the result that both their costs have been low and the usage of their facilities has been high.

The primary subject of the March meeting was to arrive at some resolutions of how to approach career education in-service training of school personnel. It is important to remember that the Career Needs Assessment Project is limited to determining what should be done and recommending how to achieve those objectives. At this point the only means of funding the in-service program is through a yet-to-be authorized grant.

The committee members had nominal input as far as the content of the in-service. They were primarily concerned with the manner in which the in-service would be conducted. Supt. Heiler stated that all personnel should participate. The committee recommended a dual in-service with the administrative personnel attending a program at each of the four centers and a subsequent program at each of the school districts with the respective faculty personnel.

Supt. Heiler identified the following concerns of administrators:

1. Orientation to the concept of career education
2. How it can be implemented
    a. cost
    b. procedures necessary

For the faculty in-service, Dave Maxwell suggested that demonstrations be conducted and that teachers of each grade level work together to synchronize their efforts.

Dellmer Sly commented that from Davenport's experience it is essential to have a person identified in each building and a district steering committee to effectively implement career education. John Manson identified the need to in-service each district based upon its own individual characterists. In response, Rich Schultz suggested and the committee agreed that the administrators of each respective school district could determine the best way to in-service their faculty regarding:

1. Time of the:
    a. year
    b. week
    c. day

2. Duration of in-service:
    a. two hour blocks
    b. all at once or over an interval
3. Incentive:
    a. personal motivation
    b. paid
    c. credit (undergraduate or graduate)
4. Voluntary or mandatory participation

The committee believed that the content of the in-service should be determined by the personnel offering it to the district.

The next meeting will be held during April, 1975 at Scott Community College - Belmont Road - Bettendorf, Iowa. The tentative date is April 16, 1975 at 3:00 p.m.

The meeting adjourned at 4:40 p.m.

Sincerely,

Tim Paul

CAREER EDUCATION DEVELOPMENT

EASTERN IOWA COMMUNITY COLLEGE DISTRICT
(MERGED AREA IX)

PROPOSED
FARM OUT IN-SERVICE COURSE

For one academic credit hour, the student will attend both sessions of the workshop and function as critic/evaluator for the completed discipline projects.

For two academic credit hours, the student will also develop at least two Career Education units within per respective discipline.

COURSE FORMAT

SESSION I

1st day - A.M.: ORIENTATION TO CAREER EDUCATION
- .1 Operational Definitions
- .2 Objectives
  - .21 "Iowa Project's", general
  - .22 "Iowa Project's", respective district's
- .3 Questions

1st day - P.M.: CAREER EDUCATION NEEDS DETERMINATION
- .4 Merged Area IX Project
- .5 Other Merged Areas' projects
- .6 Particular school district

2nd day - A.M.: RESOURCES
- .1 Existing
- .2 Needed to be effective

2nd day - P.M.: MANAGEMENT BY OBJECTIVES/BEHAVIORAL OBJECTIVES
- .3 Vargas, Mayer, Shepard, Drucker Theory
- .4 Examples
  - .41 Filmstrip
  - .42 Handouts
  - .43 Self-developed

GROUP CAREER EDUCATION UNIT
- .5 Cooperative Development

SESSION II

1st day: OUTCOME PROCESSING - VALUES
- .1 Presentation of Career Education units by discipline
- .2 Criticism/evaluation

2nd day: FINALIZING CAREER EDUCATION UNITS
Preparing final district-wide document
IN-SERVICE CRITIQUE

STEERING COMMITTEE
CAREER NEEDS ASSESSMENT PROJECT

The fourth meeting of the Steering Committee will be held on April 16, 1975 at 3:00 p.m. in Conference Room #278 of SCOTT COMMUNITY COLLEGE - Belmont Road - Bettendorf, Iowa.

AGENDA

I. What about in-service? (follow up of March, 1975 meeting)

   A. Grants written
   B. Alternate funding

II. Prerequisites for Implementation

   A. Policy statement recognizing obligations of district's board of directors stated in Iowa Code Annotated 257.25 New Section 11 and 14.

   B. Policy statement supporting obligations of district stated in 20 United States Code Annotated 1865 sections 406(a), (d), and (f)

   C. Identification of incentives for personnel to develop and implement career education

      1. Academic or barrier credit
      2. Monetary reward
      3. Release time
      4. Other

   D. Development of school district steering committee composed of all grade levels and subject matter

   E. In-service on the scope and outline of career education

   F. Document existing programs and practices

      1. Eliminate duplication
      2. Integrate omitted areas

   G. Conduct Needs Assessment of local district (Phi Delta Kappa)

   H. In-service on the development and use of career education units in the existing curriculum

I. Designate a career education specialist-coordinator

1. THOU SHALT NOT tack-on
2. Release time or reassignment
3. Hiring

J. Review existing materials

1. State needs (CENIS)
2. National projections (occupational Outlook Quarterly)
3. Comparable district's programs (Iowa Project)
4. Bread and Butterflys; Project Discovery; Career Information System for Iowa, 80-60-40

K. Project priorities and calender for completion by the local district

L. Development of continual evaluation procedure

III. Questions

SUMMARY

CAREER EDUCATION NEEDS ASSESSMENT
STEERING COMMITTEE

April 16, 1975

Present: B. Brandt, W. Cornelius, M. Heiler, B. Hoover, J. Law, D. McDonald, J. Manson, D. Maxwell, D. Miller, T. Paul, D. Sly, J. Soderlund, S. Weiler.

Tim Paul, the Project Director, opened the meeting at 3:00 p.m. in Room 278 of Scott Community College in Bettendorf, Iowa.

Presentation was made to the steering committee of the proposed in-service program. It was written in the form of a grant and submitted to the State Department of Public Instruction. At this point, however, there is no authorization to proceed and no funds are available. Alternate sources of funding are being explored, including: per pupil costs by the local district, CETA funds, and Federal seed program monies. The options available and the sources of funding will be the subject of the May meeting.

Subsequent discussion of the prerequisites for implementation focused on the items identified. Two additions to the identified prerequisites were made: to reorient; and to develop a district handbook. After the initial in-service on scope and outline on career education (item E on the agenda) the next step would be to reorient existing acquisitions to purchase career education materials. Another example of reorienting would be to use scheduled revisions in curriculum to integrate career education concepts into the revised curriculum. Developing a district handbook would take place after the establishment of the local district's priorities and calendar for completion (item K on the agenda).

In implementing career education concepts, the steering committee recognized that the larger districts would probably be able to use more funds and a larger period of time more readily than the smaller districts. However, the smaller districts would have less difficulty in bringing together all of their faculty than the larger districts would.

The committee's principal recommendation to individual districts was to recognize that career education would not be implemented in one year; rather, it becomes a continual process. Progress towards local priorities is the criteria of successful implementation.

The next meeting will be held during May, 1975 at the Central Administrative offices of Eastern Iowa Community College District - 3546 Brady Street - Davenport.

The meeting adjourned at 4:30 p.m.

Sincerely,

Tim Paul

RE: CAREER NEEDS ASSESSMENT PROJECT

Four resources will become available to Merged Area IX in the 1975-76 academic year. First, Mississippi-Bend Area Educational Agency will begin to serve all twenty-four school districts with its career education consultant, Roger Mangan. Second, the Iowa Department of Public Instruction plans on offering in-service, as well as their consultants, to the community school districts. Third, the community colleges are beginning to investigate exploratory programs that could be offered to the community school districts. Finally, each local school district will have had a full year to study the Models for Career Education in Iowa, an opportunity to review this project's recommendations, and the time to determine which objectives and activities, designed for career education, are related to its educational program.

These resources will be utilized to a different extent by each district. The options recommended by the committee are supported by these resources. In planning for next year, please consider the options and resources which would be most helpful to your district.

The final steering committee meeting will be held in September, 1975. Distribution of the project's final report will occur at that meeting.

Sincerely,

EASTERN IOWA COMMUNITY COLLEGE DISTRICT
(MERGED AREA IX)

SUMMARY

CAREER EDUCATION NEEDS ASSESSMENT
STEERING COMMITTEE

May 15, 1975

Present: B. Hoover, J. Manson, T. Paul, E. Schreiber, D. Sly, S. Weiler

The meeting began at 3:00 p.m. in the board room of Eastern Iowa Community College District's Administrative Office at 3546 Brady Street - Davenport, Iowa.

Each of the fixed positions, that were identified in the agenda, was discussed. It was recognized that "Individual District Development" has been mandated by legislation in both the United States and the state of Iowa. Options 1 and 6 were viewed as being approximately the same since their effect would be to omit any development of career education. Indeed, the six options were presented as a circular process rather than linear. Numbers 1 and 6 represent failure to act while 2, 3, 4, and 5 require varying degrees of developmental participation.

The committees final resolve was to recommend options 3, 4, and 5. Presently some cooperative efforts between community school districts are being scheduled for the 1975-76 school year (#3-"Give Up and Share"). For several years, districts in close proximity to the community college have permitted students to attend (#4-"Utilize the Community Colleges"). Neither of these is specifically directed at career education. They are constructive indications that cooperative efforts can be devised.

Career education dictates a different approach. Each individual district has the capacity to review its curriculum and document existing career education efforts (self-concept or world of work). This is more likely to be easier in grades K-6; but, even secondary school has the opportunity to present additional occupations within a particular cluster. It may be difficult to arrange work release or work study in rural districts; but the district could document its present efforts to provide a record for future revision or improvement.

This procedure for implementing career education will require some learning (i.e., a change in behavior) for personnel and districts. The community colleges should be able to provide assistance by offering programs which local districts do not offer. But, the local districts must initiate their own programs in grades K-10. Option 5 ("Develop Virgin Career Centers") is tenuous at this point. Funding is either not available or quite limited. A continued effort will be made to procure sufficient funds for the realization of this option.

What emerged from the committee was a compromise gray option. It involves mixing three identified options (#3, 4, and 5) and the recognition that #2 is essential to any successful implementation.

The final meeting will be held in September, 1975. The project's completed document will be distributed at that time.

The meeting adjourned at 4:30 p.m.

Sincerely,

Tim Paul
Project Director

OPTIONS FOR MERGED AREA IX DEVELOPMENT

Descriptions of Fixed Positions

1. NOTHING DOING

Career education is the present bandwagon and it will soon disappear. Why waste time and money on a worthless program. Kids find jobs without our help anyway.

Advantages:

1. Wait and see if it works before trying.
2. "Tremendous" dollar savings by not developing a program.
3. Permits a continuation of status quo while discounting, discrediting and disagreeing with career education until the "last" moment.

Disadvantages:

1. A defeatist attitude; a self-fufilling prophecy.
2. If career education is not a fad, if it helps people, then a mistake was made in the original presumption.
3. Quite likely local districts will be expected to show progress towards developing and implementing career education. If they can not, they should anticipate difficulty.

2. INDIVIDUAL DISTRICT DEVELOPMENT

Each local school district would autonomously develop its own career education program. All in-service, curriculum development, and new facilities would be locally developed.

Advantages:

1. Limited external input, so limited external control.
2. Consultants, that are available, could be used on a temporary basis.
3. Increase local pride by developing our own program.

Disadvantages:

1. Few local districts have the funds or time necessary to function individually.
2. No arrangement for sharing emerges.
3. This strengthens the existing provincialism and will make it more difficult to either develop cooperative programs or accept mergers in the future.

3. GIVE UP AND SHARE

Chapter 257.25 new section 17 of the Iowa Code provides for public schools to share personnel. One option that is available for the development of career education is for groups of schools to determine which area of a career

preparatory program should be done by each member school (college prepatory, vocational agriculture, vocational homemaking, trade and industry, etc.). Each member school would voluntarily give up all of the career prepatory programs being developed by another school and put the dollar savings into the one program they are to develop. The development of a single program would permit a more detailed and specific career preparation program. Member districts would then bus their students to other schools with the program desired.

Advantages:

1. A more realistic skill acquisition-job experience preparatory program in each area developed.
2. Increased cooperation between districts (future merger).
3. Possible dollar savings and retention of a coordinator for member schools to consult.

Disadvantages:

1. Loss of several broad career prepatory programs.
2. Possibility of having to dismiss some faculty in programs being taught by another district.
3. Schedule-transportation coordination.

4. UTILIZE THE COMMUNITY COLLEGES

Solicit, support and sell a joint venture permitting students to enter the community college programs and earn dual credit. High school credit would be awarded for graduation. College credit would be awarded in the event the student elects to enter a post-secondary institution.

Advantages:

1. Programs are already functioning with some schools participating.
2. Primary cost of participating is the student's payment of tuition for college credit.
3. Increase cooperation between community college and schools (improved acccuntability).

Disadvantages:

1. Some loss of control over subject matter or method of teaching.
2. Probable slight decline in senior class attending school programs.
3. Schedule-transportation coordination.

5. DEVELOP VIRGIN CAREER CENTERS

Starting de novo, plan and construct centrally located career centers. Districts could fund such a project from three sources: per pupil levy in each district, an additional tuition for students utilizing the center, and state vocational aid to partially offset instructional costs.

Advantages:

1. Within the realm of consensus by member schools, total control over the center's functioning.
2. Less cost than each district preparing its own separate facility.
3. Opportunity to utilize all positive experiences and recommendations from previously developed comparable facilities.

Disadvantages:

1. An additional facility to share.
2. Increased committment of limited available funds.
3. Likely an unnecessary duplication of existing resources, facilities and staff.

6. EXTERNAL SALVATION

If career education is so innovative, crucial to student development, and a permanent redirection of education then someone or something, somehow or someway will help us. Such an effective development will not be ignored and neglected. We can take a "wait and see" attitude. Let some external source develop a program for us.

Advantages:

1. Continued support of bureaucracy and external direction for local programs development.
2. "Massive" dollar savings by not spending on career education.
3. Since someone else will develop a program for me, I can think about other things and forget about career education.

Disadvantages:

1. Increased loss of autonomy.
2. Possible sanction for nondevelopment.
3. MONEY will be spent; why not on career education as a means of improving a new math, science or reading series.

SUMMARY

SOCIAL SERVICE AGENCIES STEERING COMMITTEE
CAREER EDUCATION NEEDS ASSESSMENT

May 27, 1975

Present: J. Cadena, B. Hoover, T. Paul, M. Seikola, J. Watson, S. Weiler

The meeting began at 3:00 p.m. in the board room of Eastern Iowa Community College District's Administrative Office at 3546 Brady Street - Davenport, Iowa.

This meeting consisted of an initial effort to both apprise social service agencies of the career education concept and identify needs of the agencies and their clients. The results of the questionnaire were presented to the committee in hierarchical arrangement.

Explanation of career education's five stages and two dimensions was given with specific reference to the career prepatory-supplementary stages and the self-concept dimensions. Most of the agencies deal with individuals needing either initial skill training or retraining and having negative self concepts. The general conclusion was the recognition that clients live in quiet desperation and require an increase in their options or choices to modify this static situation. Once exposed to alternatives, the client can exercise control over his/her life. Basic skill training and awareness of options enhances self concept. By increasing the clients' choices the two common characteristics afflicting them can be diminished. As a specific suggestion, cooperative offering of short duration, (perhaps four weeks) certificate granting, health oriented courses could be initiated.

Apart from this overall recommendation, the committee did tend to agree with the priority of the needs based upon the returned questionnaires. Interest was expressed in participating with local educational agencies when career education in-service is offerred. Strategies and methods of participating in career education include:

1) joining the in-service that the State Department of Public Instruction intends to offer local school districts during October, 1975

2) requesting Roger Mangan, the career education consultant for Mississippi Bend Area Educational Agency in Davenport, speak to the agency

3) request assistance/cooperation from the State Department of Social Service and the State Department of Public Instruction

4) request local school districts or the local community college to offer specific programs for clients

The meeting adjourned at 4:30 p.m.
